The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apparture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

[Continued from Page 329.]

without much effort. From this point, however, owing to the loose and sliding material, the ascent proved a very severe task, far exceeding anything I had previously undertaken.

Barometrical measurement showed the summit of the cone to be six hundred feet above the plane at its base—the exact height, I believe, of that of Vesuvius—it possesses a well defined outer rim of some six hundred feet in diameter. Within the rim, after a descent of about sixty feet, a level bench is reached, on which one may walk entirely around the inner crater, which is funnel-shaped, and about 90 or 100 feet in depth.

The crater exhibits no signs of having contained water. A few small willow twigs are to be seen growing within the outer rim. Judging from the appearance of the lava bed, as viewed from the summit, and the present condition of the material, it would seem that the present cone has thrown out but a small portion, if any, of the lava in view, but rather that it has been elevated by forces acting directly beneath the site it now occupies. The amount of ashes and pumice which have evidently been discharged from this cone is, however, amazing.

In the immediate neighborhood of the cone the deposit is from 12 to 20 inches in thickness, and two miles away it is five or six. I traced this deposit for four or five miles to the southwest, and Obed Field, one of my guides, informed me that to the northwest it extends fully ten miles. To the eastward the deposit is not so extensive. Yet it is safe to state that a breadth of 80 or 100 square miles has been covered by the ashes from this volcano. Small bits of pumice of the size of a bean are plentifully mixed with the deposit.

The ashes are of a dull, gray color, differing in this respect from any other I had previously observed in the State, and as they offer but little resistance to the wind, no signs of drifting are apparent, and they rest evenly upon the surface as they fall. My reasons for believing this volcano to have been of recent origin may be briefly stated. In Snag lake, across which the dike of lava extends, there are several dead trees still standing, while on the lake shore are many trees and stumps battered and torn by ice, which have been driven upon the beach by the wind. This is notably the case upon the eastern border of the lake, where they may be counted by the hundred.

These facts clearly indicate that a large portion at least if what is now the bed of the lake has but recently been a forest, and that the presence of the lava has been the cause of the change in the level of the water. Again, along the borders of the lava bed there are a number of trees still standing with lava nearly or quite encircling them, their dead and blackened trunks furnishing incontestible evidence that the eruption occurred while they occupied their present positions.

To the west and northwest of the cone an open space exists of a hundred acres or more in extent—bounded on the west by forests—the trees upon which have nearly all disappeared. There exists to my mind the clearest evidence that the vegetation upon this tract was destroyed by the shower of hot ashes. The trees still standing are burned upon all sides precisely as a green tree burns, a thin stratum of charcoal, still adhering to the surface of the remaining wood. A few trunks have fallen and they rest on the surface of the heavy ash not partially buried in it. No traces are perceptible of fallen timber lying beneath the ash, as that would naturally have been entirely burned away.

I observed many concave depressions dotting this field of ashes. These depressions were from six to ten inches in depth and from one to four feet in diameter with sides sloping toward the center. Where one of these occurred, on digging through the ashes I invariably found traces of a charred or decaying tree stump. In the forest beyond the trees were invariably surrounded by a zone of ashes. Further evidence of this recent shower may without doubt be obtained by a thorough examination of the living trees in the vicinity. Many small cavities at the point where the branches are thrown off will yet disclose a store of ashes to reward the search.

A large number of trees still living in the adjoining forest show scars, and the new wood formed by the reparative process, is apparently of but a few years' growth, although, as I had no axe I was unable to verify this statement by count of the annular rings in the new wood. I had forgotten to state that there was one living tree in the field of ashes, but it has lost its top and its scarred trunk indicates a desperate struggle for life.

I have endeavored to place before you this evening all, as I believe, of the more important facts upon which I base the supposition that this volcano has been in active operation within 25 years. Much of this evidence will soon disappear. The ice in another winter, perhaps, will have lifted the last tree from its place in the bed of the lake, the concave depressions in the ashes will gradually become less distinct, and the trees encircled in the stony embrace of the lava will soon decay, yet the characteristics of the volcano itself are so marked that it will, for a century to come, be recognized as of recent origin. I had traveled for weeks over a country every inch of which exhibited traces of volcanic action. Yet there always existed something to show that nature was endeavoring to repair the mischief which had been wrought. By disintegration the unsightly lava blocks were being converted into soil on which vegetation was luxuriating, and where animal life can find subsistence. I had climbed very many well wooded volcanic peaks to find that within the very craters large trees were growing and the sides converted into grassy slopes. Here, however, the lava bed was as sharply defined as though it was a fortress in an open plain, and although surrounded on all sides by volcanic ruins it appeared as fresh and new as though the creation of but a day.

Since my oral report to this society four different gentlemen have furnished me with reports which, in my estimation, must be considered as corroborative proof of the existence of an active volcano about the period named. Dr. Wozencraft informs me that during the winter of 1850–51 he was residing at a point some distance above Red Bluffs, when he observed a great fire to the eastward of Lassen, which continued for many nights without change of position. The Doctor states that some of the observers expressed the belief on the first night of its appearance that it was the light from a large Indian camp fire. The reappearance of the great body of flame for so many nights in succession, however, seemed to shake their faith in the camp-fire theory. The Doctor at the time and since, has earnestly advocated the theory that the phenomenon was the result of a volcano in active operation.

Dr. J. B. Trask also states that at about the same period he was near Rich Bar on the north fork of the American river. He, too, distinctly remembers the display for many nights in succession. From his point of observation the distance cannot be more than forty miles to the cone.

Mr. Charles Gibbes stated that he and a party of miners witnessed the same spectacle while at Angel's camp and referred it to an eruption of a volcano. Himself and comrades, in their estimate of the distance to the supposed volcano, placed it at 150 miles; in point of fact it is about 160.

Mr. Henry Chapman, a member of the Academy, writes that during the summer of 1851, he resided for a short period at a wayside hotel near Georgetown, El Dorado Co. One evening, two prospectors arrived at the hotel who stated that they had been since early spring in search of the mythical gold lake. They informed the company that they had traveled toward the north for a distance of more than 200 miles without discovering gold. They stated that they had however discovered a boiling lake and a volcanic mountain, which "threw up fire to a terrible hight," and a large breadth of country still on fire, as the result of an eruption. They stated further that at one point they traveled for a distance of ten miles across a strip of country where the rocks were still so hot as to entirely destroy their boots, they losing a horse and one mule during the transit. They placed the location of the mountain at an estimated distance of 100 to 125 miles, in a northerly direction from Georgetown. By referring to the new geological map of the State, it will be seen that the distance from Georgetown to the Cinder cone I refer to, is about 115 miles. If this statement can be relied upon, the burning country they mention must have been the belt of hot ashes which I have described.

The boiling lake referred to is doubtless one which is still in existence it being located about eight miles to the south of the Cinder cone.

It is oval in shape and contains an area of a little more than four acres, with an elevation of 5,976 feet, and is surrounded by hills of 100 feet in hight broken only at one point by a fissure which admits the escape of surplus water. Around the borders of this lake I found a large number of mud cones from one foot to four feet in hight formed of finely pulverized volcanic rock. These miniature craters were in a state of ceaseless activity ejecting mud and sulphurous vapor.

The water of the lake itself was hot, of a creamy color and the surface from time to time disturbed by the escape of gasses from the earth beneath.

My guide informed me that the lake is much more tranquil than at the period when he first beheld it 10 or 12 years since, and indeed there exists abundant evidence to prove that this district is rapidly cooling. A mile or so to the south of the lake there is a geyser ejecting boiling water to the hight of 10 feet, and Field assured me that in former times the water was elevated to a hight of 20 or 25 feet. While three or four miles to the westward there exists a huge geyser cañon with hundreds of springs still in action, yet there are many large cauldrons which have ceased action altogether.

Oaklanders' Local Option Memorial.—On Saturday of this week a memorial drinking fountain will be dedicated in Oakland. The fountain will be situated at the junction of San Pablo and Telegraph avenues, near the City Hall. Its cost, including its mounting with an appropriate statue, will be upwards of $800. Temperance organizations of San Francisco and other places will join those of Oakland in commemorating. Letters have been received to the number of 125 by the committee on invitations from parties who intend being present from different parts of the State. Able speakers will be present. A grand concert will be given in the evening by noted singers and the Harmonic Society of Oakland. An immense number of tickets have been sold. The entire proceeds will go for erecting fountains in different parts of Oakland. The Contra Costa Water Company generously supply the water free. It is stated that this will be the first temperance monument ever dedicated in the United States.

W. L. Church, formerly newspaper agent, will please address this office.

General News Items.

Pacific Coast Postal Changes.—The following Post Office changes on the Pacific Coast were made during the past week: Offices were established at Cross creek, Tulare county, California, and Charles H. Robinson was appointed Postmaster. At Glenville, Kern county, California, and Jos. Meyers appointed Postmaster. Offices were discontinued at Mountain House, Yamhill, Oregon; at Hampton, El Dorado county, California. Postmasters were appointed as follows: Robert F. Campbell, Cisco, Placer county, California; J. W. Roberts, at Walker, Sacramento county, California.

A Gift from George Francis Train.—Train donates about 400 acres to Omaha as a public park, on condition that the city assumes certain indebtedness, about $90,000, while the property is valued at five times that amount. Mr. Train makes this offer to the city in a characteristic letter. One of the conditions is that there shall be no vote of thanks or monumental compliments. He says he don't want to do any death-bed advertising like Astor, Peabody and others, but follows the example of Lick of San Francisco.

Resumption of Specie Payments.—The telegraph says the President has made up his mind to take a decided stand in favor of the resumption of specie payment, in his annual message. It is understood that he will recommend Congress to perfect legislation for specie resumption, and favor specially some date, several years hence, on which the Government should resume. He does not suggest a plan of his own, but believes that legislation can be devised by which the government can resume in 1876.

Carlism Crushed.—The latest dispatches from the Spanish Republican army to the Government are of the most encouraging nature. Army officers report that but few bodies of organized Carlists are now in the field, and those have been so weakened through desertions and other causes, as to be unfit for any aggressive movement. It is believed that Carlism has been effectually crushed.

Warlike Villainous Saltpeter. — Agents of a European Government have contracted with a firm in this city for the purchase of 3,500,000 pounds of saltpeter. This, probably, will be used for the manufacture of gunpowder, and its purchase has given rise to rumors of coming conflicts between European powers, possibly Russia and Germany or China and Japan. It is not known what Government is the contracting party.

Immoral Chinese Women.—Congressman Page, of this State, had an interview with the President a few days since, in relation to the coolie trade and the importation of Chinese women for alleged immoral purposes. The President was very decided in his opinion that such importation was in direct violation of the treaty with China. He will call attention to the subject in his annual message.

Heavy frauds against the Government have been discovered in New York, perpetrated by W. J. Pollock & Bros., who have absconded. Frauds have been discovered to have been committed by them to the extent of $170,000, chiefly through smuggling silk and other fine goods. Warrants have been issued and they, with several others implicated, will likely be arrested early next week.

Become an Honest Man.—It is said that Andrew McGarvey, the New York Court House plasterer of the Tweed Ring, who was paid $400,000 for work not worth one-twentieth of the money, is now earning four dollars a day as an iron worker in a Market street shop, in this city. If he has gone to work, there is hope that he may become an honest man.

Coal Oil Lamp Explosions.—During the past week we have noticed the occurrence of two coal oil lamp explosions in this city, which fortunately did but little damage. One also occurred on Saturday last at Cheyenne, which resulted fatally. All these have occurred through sheer carelessness, or ignorance of the nature of coal oil.

Frightful Railroad Accident in Italy.—A frightful accident occurred a few days since on the railroad between Bologna and Ancona, attended by heavy loss of life. Two passenger trains collided. Both were totally wrecked. Thirty-five persons were killed and injured. The cause of the accident is not stated.

The Nevada Legislature.—As nearly as can be stated, from returns so far received, the Nevada Legislature will stand: Republicans, 47; Opposition, 28.

Mint Removal.—The office and official documents of the Superintendent of the New Mint have been removed to the new Appraiser's stores, on Washington street.

D. D's.—One hundred and thirty-six degrees of Doctor of Divinity have been conferred by colleges in the United States this year.

The Ross Boy.—The parents and friends of the little Ross boy have already expended over $100,000 in their fruitless search for him.

Bridges Washed Away.—The temporary bridges at Lisle's Bridge, American River, were washed away Saturday.

The Reason.—A Danbury little darkey refused to go to church "kase he didn't want to look there like a huckleberry in a pan of milk."

Great Earthquake in Chili.—The latest mail advices from Panama say that the recent earthquake in Chili was the greatest experienced since the memorable one in July, 1873. Valparaiso and Santiago appear to have been almost on the focus of the intensity of the shock. Its duration was half a minute, and its direction east to west. It is known to have extended far out to sea. It was estimated that the total area confused was not less than 1,500 square miles. Cases of serious injury were very few.

California's Poet.—Joaquin Miller is reported as having lately eloped from Florence, Italy, with an Italian married woman, the mother of several children. The affair is said to have produced a great commotion in the society of that free-loving city. It is said that the report comes well authenticated, and at all events it will be a good advertisement for the adventurous bard.

Paul K. Harbs, one of California's early pioneers, died suddenly at his residence in Vallejo, on Tuesday last, at the age of 75. The deceased was most repected as a citizen and public man. He was a prominent man in the early political history of the State. He was elected the first Superintendent of Public Instruction, represented Tuolumne in the State Senate in 1851–2.

Terrible Steamboat Calamity.—The steamer "Empire," of New Orleans, lately sank in a mysterious manner, near that city. The Captain, who lost four children by the disaster, states that the boat did not break in the middle, and was not overcrowded. He cannot understand why it sunk. It is supposed that the victims will number thirty-five.

Attempted Suicide.—On Friday night of last week a man was found stuck in the mud, near the foot of Folsom street, in this city. He was naked and in the mud up to his arm pits. It was a case of attempted suicide. He did not observe, in the dark, that the tide was out.

The Pennsylvania Mine Troubles.—Lawlessness in the Pennsylvania coal regions continually increase, and the outlaws go unpunished. At Caroondale, on Saturday night or Sunday morning last, two men were murdered, and three severely assaulted, one of whom will probably die.

Austria and Prussia.—The Austrian Minister of Public Instruction has resolved to take measures to purge the Austrian schools from Prussian teachers and Prussian school books. An investigation is now being made as to the number of foreign teachers employed at the Austrian Universities.

Cheap Living.—In a certain Paris restaurant in Rue de Trinité a plate of meat, a plate of vegetables, a dessert and half a bottle of wine are now served for nine cents; and a writer on the *Figaro* having eaten, pronounces it a good meal.

Germans and the Pope.—It is reported that Prince Bismarck has intimated to the Vatican that unless the usual forms are strictly followed in the next election of the Pope, the German Government will withhold its recognition.

Cremation Prohibited in Saxony.—The Government of Saxony has forbidden the practice of cremation.

Deaths for the Week.—Seventy persons died in this city during the week ending with Saturday last.

Palace Hotel.—The sixth story of the Palace Hotel is completed. In this building each brick partition is continued to the roof, so that each partition is in itself a fire wall. The magnitude of the undertaking and its peculiar relation to the interests of the city give it an interesting prominence, and the minor detail that in a less pretentious structure would be passed in indifference, are in this case eagerly ascertained and discussed. For every foot of hight gained in the seventh story of the building 139,290 bricks are required. The flues of the building number 2,042. This number embraces 794 for fire-places, 16 for the kitchen, 1 for the boiler, 755 ventilating flues for rooms, 140 flues for working rooms, and 336 flues for bath rooms. The structure requires 4,000 doors for its 900 rooms. The hotel is 350 by 275 feet, covers an area of 96,250 square feet, and is seven stories high. The lower story is 25 feet high, and the others 14 and 16, and all walls and partitions throughout the house are built of stone and brick, laid in cement, and banded together with iron.

The San Jose *Mercury* is again calling attention to the stone quarries which abound in Santa Clara county, and says: "The fact that we possess the best building stone in the known world, and which can even now be furnished at less prices than San Francisco contractors are charging for brick, will hasten the time when all imitations will be discarded and our edifices be hewn out of the eternal rocks."

Don't Hazard Your Life.—A lighted torch in a powder mill is scarcely more dangerous than a deep-seated cough or cold. The individual who waits for such an insidious enemy of life to die out itself, commits a frightful error. It is an inexcusable error too, for *Hale's Honey of Horehound and Tar* will cure any irritation of the throat or lungs with a dispatch and thoroughness which preclude all necessity for apprehension. No type of cough, cold, influenza, or bronchitis can resist its strengthening, soothing, healing operation.

Pike's Tooth-Ache Drops—Cure in one minute.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Nov. 17th, 1874.

FOR WEEK ENDING NOV. 3d, 1874.*

MACHINE FOR SEWING SACKS AND BAGS.—Howard P. Garland, S. F., Cal.

CABDURETER.—Louis Marks, S. F., Cal.

CHEESE VAT AND STEAM HEATER.—John S. Woolsey, Gilroy, Cal.

STAVE MACHINE.—Lamartine R. Fulda, S. F., Cal.

DIVING APPARATUE.—John Peter Schmitz, S. F., Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

From an Inventor.

The following letter, which was recently received from an old client of Dewey & Co., now residing in one of the Eastern States, speaks for itself, and will do more, perhaps, to convince inventors of our capacity for business than any number of local compliments. We extract as follows:

GENTLEMEN: It was through your honor that I secured my first patent, and although I have since done business here in the Atlantic States with the ablest patent solicitors—gentlemen who have done me justice—yet I have often regretted that you were too far off to advise with me in my cases. It has taken a longer time with every patent I have taken out since I left California and came East, than in the cases you prepared for me in San Francisco, which is certainly very creditable to you.

By the way, one of my patents has passed the ordeal which is the essential test of a patent's value. I mean that of a trial in the courts, and it stood the battling of one of the best lawyers in the country. The specifications and claims were completely made out and there was a perfect comprehension of its principle during the trial. Since giving it this test we thought that we would make it even stronger, if possible, and submitted it to one of the best patent solicitors for advice. After a careful examination of the case he advised us to let it alone as it stood, saying that whoever made up those papers understood their business. I then informed him that they were drawn up by Dewey & Co., of San Francisco, and he replied that he knew you well by reputation. * * * * * Very truly yours,

L. L. SAWYER.

Meriden, Coun., May 16,

TWENTY CENT COIN.—The proposed issue of 12½ cent coin is denied at the office of the Director of the Mint. The issue of 20 cent coin is favored, but 12½ cent pieces are not, and will not be approved at the Treasury Department.

THE Goodyear Rubber Company have imported from the East the largest rubber hose ever brought to this coast. It is intended for a mine in Australia, and is 14⅝ inches in diameter.

THE Moore claim, 800 feet on Deae creek, yielded $48,000 as the summer's work, with 400 feet of the bed of the creek and the banks still untouched.

BARNES, owner of the chrome iron mine near Cloverdale, has shipped this season 1,700 tons to San Francisco. It is shipped from here to Philadelphia.

THE Calistoga *Free Press* is making a choice collection of minerals from the different silver and cinnabar mines in Napa and adjoining districts for the Centennial Exhibition.

On the road from Eureka to Rnby Hill the mud averages three feet in depth, and teamsters find it almost impossible to get their ore wagons from the mines to the furnaces.

PREPARATIONS are being made to open up a number of hydraulic claims in the vicinity of Jackson, Amador county.

SITKA MINES.—A very rich quartz ledge has been struck 12 miles from Sitka, Alaska. The quartz is broken and porous, showing free gold plentifully.

THE population of Virginia City has doubled during the past four years.

QUICKSILVER is still quoted at $1.55 per pound in this market.

THE miners have stopped work on the Klamath river, owing to the high waters.

MANY persons are leaving Eastern Nevada for Panamint district.

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Sample copies, 25 cts

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published and issued, wholesale and Retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver, and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 176 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

F. B. ALDERSON—Nevada.

THE SCIENTIFIC PRESS.—This valuable journal entered upon the seventeenth year of its publication on the 4th of July. The steady advance in character, that every reader has noticed in the paper, renders it unnecessary to make any splurge of improvement, and the publishers simply content themselves with the announcement that they will continue to make their paper as interesting as possible. That it is interesting to a large class of readers, the wide circulation and extensive influence of the PRESS, is sufficient evidence.—*Placer Argus.*

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.60—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and replaced in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 26 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. lambp

And in accordance with law, and an order of the Board of Directors, made on the 25th day of September, 1874, so many shares of each parcel of said stock as may be necessary will be sold at public auction at the office of the Company, Room No 1, 631 California street, San Francisco, California, on the 24th day of November, 1874, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WM. SMALL, Secretary.

Office—Room No. 1, No. 531 California street, San Francisco, California. no7-2t.

Keystone Quartz Mining Company—Location of principal place of business, San Francisco, California. Location of works, Butte township, Sierra County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of November, 1874, an assessment of one dollar ($1.00) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Northwest corner of Sansome and Pine streets, San Francisco.

Any stock upon which this assessment shall remain unpaid on Monday, the 21st day of December, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 11th day of January, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Secretary.

Office, Northwest corner Sansome and Pine streets, San Francisco, California. nov21-5t

Land Purchasers' Association—Office, No. 331 Montgomery street, Room 7, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Directors or Trustees of this corporation, held on the 28th day of October, 1874, an assessment of ten dollars per share (being the 42d monthly installment on the subscription to the stock) was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at No. 331 Montgomery street, Room 7 San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of November, 1874, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the 24th day of December, 1874, to pay the delinquent assessment, together with costs of advertising and expense of sale.

O. S. WRIGHT, Secretary.

Office, No. 331 Montgomery street, Room 7, San Francisco, California.

☞This assessment is levied to pay the taxes on the property for 1874 and 1875.

The Orleans Mining Company—Principal place of business, San Francisco, California. Location of works, Grass Valley Township, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of October, 1874, an assessment (No. 1) of one dollar per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary at the office of the company, Room 8, 315 California street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the 24th day of November, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 15th day of December, 1874, to pay the delinquent assessment, together with costs of advertising and expense of sale.

J. F. NESMITH, Secretary.

Office—Room 8, No. 315 California street, San Francisco, California. oc24

Owens Gold and Silver Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Julian Mining District, San Diego County, Cal.

Notice is hereby given, that at a meeting of the Directors held on the second day of November, 1874, an assessment (No. 3) of one dollar per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, room No. 4, Hayward's Building, No. 419 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the seventh day of December, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 28th day of December, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Office, Room No. 4, Hayward's Building, No. 419 California street, San Francisco, California. no7-5t

Virginia Consolidated Mining Company.

In accordance with a resolution adopted at a meeting of the Board of Directors of the Virginia Consolidated Mining Company held this day, a special meeting of the Stockholders of said Company is hereby called, the same to be held at the office of the Company in San Francisco, No. 318 California street, Room 13, on Monday the 21st day of December, 1874, at 2 o'clock P. M., to take into consideration and decide upon the proposition to increase capital stock of said company from three million dollars, divided into thirty thousand shares of the par value of one hundred dollars each, (the present capital stock,) to six million dollars, divided into sixty thousand shares of the par value of one hundred dollars each. Also, for the transaction of any other business that may properly come before the meeting. By order of the Board of Directors.

EUG. CHEVIOT,
ROBT. P. CHASE,
A. F. BENARD. } Directors.

507 MECHANICAL MOVEMENTS,

Illustrated and described.

Inventors, model makers and ameature mechanics and students, will find the work valuable far beyond its cost. Published by DEWEY & Co., Patent Agents and publishers of the Mining and Scientific Press. Price, post paid, $1.

BRITISH MINES.

The undersigned, as correspondent for the London "Mining Journal," will be glad to receive communications from parties engaged in foreign mining operations on this coast.

EDWARD JACKSON,

310 Clay Street, S. F.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery o the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBBS & CO.,

de20 611 and 613 Front street, San Francisco.

Large Profits from Low Grade Ores.

We have often read accounts, seys the *Foothill Tidings*, of the wey they do things in Australia; of dividends peid by English companies operating there on rock that works no more then $2 per ton. When looking over the figures of one of these reports to the London stockholders, it invariahly strikes us that there must be something wrong here where we let fair sized veins of quartz whiob afford plenty of rock that will average $8 to $10 per ton lieidle, end condemn them as worthless.

It mnst bave been with something ekin to tbis feeling that Captain Miller—snperintendent of the Darmonth gravel mine in this place and also largely interested in some of those great veins of quartz up in Washington townsbip, of this county—made a trip not long since over into Sierra connty, to see how a full blooded English corporation managed the famons Sierra Buttes mine and witb whet results. In e pleasant conversation bad with the Captain one evening this week, we learned many facts end particnlars which cennot fail of interesting onr mining readers, and we present snch es occnr to us at this time.

Tbe situetion of this mine is ebout es forbidding as any in the State. First, it is located high up in the snow belt, where for eight months of the yeer people are snowed in and the weather is very severe; and second, after reaching Sierra City, the nearest habitable place to the mine, one mnst climb 1,200 feet np the mountain to reach the works. This is now easily eccomplisbed however, as a nice greded road, three miles in lengtb aronnd the monntain, has been constructed. We mention this point of inaccessibility in winter, for the reason that it is the great hngbear hrought against the mines of Washington and Eureke in this connty.

Tbis, it will be remembered, is the mine sold by Reis & Co. to en English compeny in 1870. This company has added another mill to the two already built. Tbese three mills ere sitnated below tbe montb of the tnnnel, end one below the other, so that the seme stream of weter drives the whole, being nsed on each in snccession. The upper mill has sixteen stamps, the next thirty and the lower one forty—eighty-six in all. Below the mills, along down the monntain side, are ten or twelve errastres, driven by tbe waste water and working on the tailings of the mills. These are owned by ontside parties, some of whom beve realized snng fortunes from this weste.

The tunnel is driven in on the ledge end the ore, taken out in large cars drawn hy mules, is delivered by cbntes to the different mills. The ledge varies in thickness from 10 to 20 feet and the whole body of quertz is taken out. The averege value of the ore milled the past year was about seven dollars per ton, end yet during the year the amonnt divided among tbe English stockholders is seid to bave heen $274,000. Pnrsuing his inquiry for tbe pnrpose of finding how this was possible, onr informent fonnd that the average cost of extrection and rednction wes $2.04 per ton; chargeable to mining, $1.24; milling, 80 cents. The company owns tbe water to drive its mills; hires its men—250 English miners—hy the month, and has immense buildings on the grounnd for hoarding and lodging them. Tbat to the tunnel is largely due this low cost of working may he inferred from the adjoining claim on the same ledge, the Independent, also owned and menaged by an English compeny, which, being worked throngh a sheft and obliged to pump and hoist—thongh done by water power—finds its mining end milling average $4.62½ per ton.

Who does not know of scores of quartz ledges in this county with all tbe advanteges of the Sierra Bnttes mine and minns some of its disadventages? And why mey not some of these he made to pay a quarter million yearly if properly opened up and worked?

RICH STRIKE.—Johnny Schmidt, who owns a ledge ont on Woods' ravine, is again in luck. He hes heen working his mine for several years, and at times it wes very rich, but efter incurring considerable expense some time since in erecting hoisting works, and the mine snbseqnently failing to pey as well es usnel, he found himself in debt, and hed to mortgage the mine. He hes continned work however, and a few deys since he struck some very rich rock. His son took ont in a half day over a thonsand dollars, enough in faot to pay off all bis indebtedness. He has now two tons of rock ont, from the same piece, and seys it is very rich. Fine gold can he seen all throngb it. The strike comes in at the right time for Mr. Schmidt. His persistency in working the mine under disconreging circumstances is worthy of reward.—*Nevada Transcript.*

MINING DECISION.—The Commissioner of the General Land Office decided the cese of the Mammoth Blne Gravel Mining Company of California vs. The Central Pacific Railroad Compeny in favor of the former, holding thet the 1534 acres of land in controversy, sitneted in Nevada county, is mineral in character. It is also held, however, that when a patent issues to a mining company it will be necessary to exclnde from the patent all timber growing npon odd-numbered sections within the railroad grant, except snch as is necessary to support the improvements of mining operations. The latter rnling will be applied to all similar cases.

Sierra County Quartz Mines.

A correspondent of the *Post*, writing of the mining interests of Sierra county, California, has the following to say of the Sierra Buttes mine: At the present time there are claims being worked in this county, both quartz and gravel diggings, that are among the richest in the State. We have afforded us some reliable statistics about several of these mines that must be read with great interest by all persons concerned in the prosperity of California. We often grow excited over descriptions of mines located at a long distance off, while richer ones near by produce no excitement. It must be upon this principle that we hear so little about the Sierra Buttes quartz mine, which, if not the very best, is at least one of the best gold mines on the Pacific slope. It is situated about twelve miles east of the town of Downieville, upon a spur of the Butte mountain, a very high peak of the Sierras. The mine and mills are about 6,000 feet above the level of the sea. It was located in 1851, there being a group of three ledges, and the claim is about 3,000 feet on three ledges. It is one of the mines that never required any assessments, being first worked by arrastras, next by Chile mills, and latterly with stamps and pans. It has produced regularly and paid largely for over twenty years. The yield from the mine has gradually increased as the working facilities were enlarged up to the completing of the three fine mills by the English company. The original stockholders were bought out by Wood & Illinsworth, and these parties sold out to Reis Bros. & Co. for $160,000 in 1858, and by them sold in 1870 to the present proprietors, an English company, for $750,000, and is now valued at $3,000,000 in the London market.

There are three mills now running, having an aggregate of ninety stamps, with pans attached, all run by water power. The water is brought from mountain lakes in a flume seven miles in length. These lakes are about 6,500 feet above sea level. The old flume has been replaced by a new one this last summer. These mills are built upon the most improved plan, with the latest apparatus for saving gold; they are solid structures and cost large sums of money. Two of these mills were built by the present owners and work to perfection. The present company crush all the rock taken out of the ledges; the former company, with two mills, twenty-eight stamps, used to select the rock. The mills were all old and no pans used, and yet in a run of six weeks they always cleaned up from $30,000 to $50,000. Under their management the mining, delivering and crushing cost about $5 50; under the present not more than $4.50. The late company employed from 50 to 75 men. The new company about 300 men. The wages now are at least 20 per cent. less than formerly. Great improvements in buildings have been made. It is said that this new company have expended near $400,000. The quartz, or metal as it is called, is run out from the ledge into the mills. The mills are built at the end of the lodes in the side of the mountain. This is one of the purchases in which the buyers were not "hit," and which did credit to the country. This mine was sold for less than it was worth. This company have also bought the Jamison mine from Parrott for $1,000,000, and, like the Buttes, have put it in perfect order. The Sierra Buttes mine is well worth a visit. It is paying splendidly, and the manner in which it is being worked does credit to the owners.

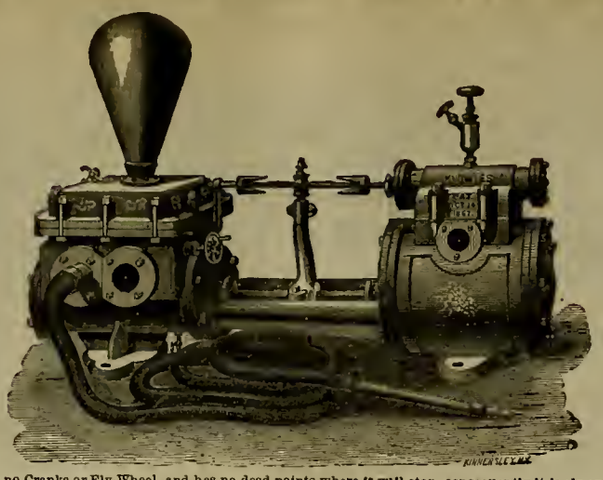
Successful Blast.—At a quarter to three o'clock yesterday there was 10,000 pounds of powder exploded in a drift at the Menzanita mine. The drift was under a point which was about 135 feet high, and 250 feet across the top. The blast was fired by means of electricity. The whole mass was thoroughly broken up, and when we left the scene large caves were taking place, not only over the blast but from the immense bank surrounding. The concussion near the blast was not as great apparently as it was in town, three-quarters of a mile away. Loose plastering in many buildings fell, and glass was broken out of windows. An earthquake shock was supposed to be the cause by those who were ignorant of the blast being fired. Buildings trembled to their base, and there was a commotion in several places. It was intended that a notice should be given in the *Transcript*, but it was uncertain at what time the blast would be fired, so nothing was sent us for publication. The execution done by the explosion was in every respect a success. The amount of dirt loosened will keep the pipes going for some time.—*Nevada Transcript.*

The Ordnance department is having constructed back of its building on Mare Island a platform from which to fire heavy guns. It is proposed to make some tests of the force of powder, testing both the velocity with which it impels a projectile and the range it gives. Shells filled with sawdust, or something else having about the same weight as powder, will be used in the experiments, and will be fired across the island into the bay beyond.

Diego A. Sutil, of Chile, is now on the Comstock range as an agent to collect specimens of gold and silver ores for the great International Exhibition of Chile, to be opened at Santiago, September 16th, 1875.

The North Bloomfield Gravel Mining Company is making rapid progress towards the completion of of their extensive tunnel and their works. The tunnel, when completed, will be more than three miles in length.

KNOWLES' PATENT STEAM PUMP.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, Cal., January 14, 1873.

A. L. FISH, Esq., Agent of the Knowles Steam Pump—Dear Sir: In reply to your inquiry as to the merits of the Knowles Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have now over 30 of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours, truly, A. J. STEVENS, General Master Mechanic.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth Industrial Mechanics' Fair in San Francisco, was a First Premium and Diploma, awarded to Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.
W. H. Williams, Sec'y Board of Managers Eighth Industrial Exhibition, M. I.

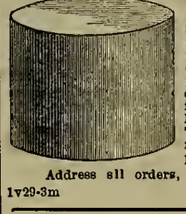
Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.



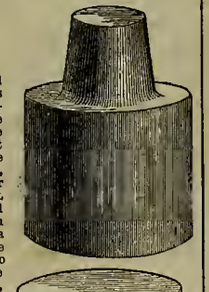
[PATENTED MAY 26TH, 1874.]

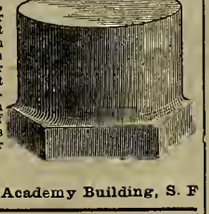
Price Reduced to 16 Cents Per Pound.

San Francisco, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce Shoes and Dies superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no Steel Shoes and Dies made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise Steel Shoes and Dies which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our Steel Shoes and Dies are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 60 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.





Address all orders, with dimensions, to

The Mining and Scientific Press--Ever Onward.

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information, in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS is not strictly a "paper for professional scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns; Such instances have been repeatedly reported to the editors and proprietors during their long connection with the PRESS. Our paper presents

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and, to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—$4 per annum Single copies, post paid, 10 cents. Address

DEWEY & CO.,

MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS Office, 224 Sansome St., S. F.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering two or four sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, baryta and quartz; and pyrites from quartz.

Added to a battery of stamps these machines constitute a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 15 or 20 tons per 24 hours.

For particulars apply to,

Ayer's Hair Vigor
—FOR—
RESTORING GRAY HAIR
TO ITS NATURAL VITALITY AND COLOR.

Advancing years, sickness, care, disappointment, and hereditary predisposition, all turn the hair gray, and either of them incline it to shed prematurely.

AYER'S HAIR VIGOR, by long and extensive use, has proven that it stops the falling of the hair immediately, often renews the growth, and always surely restores its color, when faded or gray. It stimulates the nutritive organs to healthy activity, and preserves both the hair and its beauty. Thus brashy, weak or sickly hair becomes glossy, pliable and strengthened; lost hair regrows with lively expression; falling hair is checked and stablished; thin hair thickens; and faded or gray hair resume their original color. Its operation is sure and harmless. It cures dandruff, heals all humors, and keeps the scalp cool, clean and soft—under which conditions, diseases of the scalp are impossible.

As a dressing for ladies' hair, the VIGOR is praised for its grateful and agreeable perfume, and valued for the soft lustre and richness of tone it imparts.

VOLUME XXIX Number 22.

Hydraulic Mining in California.*

The origin of this branch of mining dates back as far as the spring of 1852, and illustrates the old adage, that necessity is the mother of invention. The crevicing knife and spoon had done their duty; the gold rocker was generally displaced by the "Long Tom". and "Grizzley," and these again were superseded by long lines of sluice boxes; and, *pari passu*, the fissures and crevices in the exposed or denuded bed rock on the river banks were relieved of their gold nuggets; the shallow ravines were mostly worked out; rich gravel leads were followed into sides of hills or mountains — hiding themselves under apparently worthless masses of earthly matter, the hight of the latter increasing with every step onward, and the miner saw neither "stripping" nor "ground sluicing" could secure to him a proper reward for his labor.

Besides this increase in labor and decrease in pay the frequent occurrence of accidents by the caving of banks urged the adoption of other plans for working. Tunnels and drifts were started in many places; shafts were sunk and gold-bearing strata of gravel were found, one below the other, the richness generally increasing with depth. The richest deposit was worked by drifting, and the mine was abandoned as worthless after this was extracted. Thus stood matters in the spring of 1852, when a miner, whose name is not remembered, put up a novel machine on his mining claim at Yankee Jim, in Placer county. This machine was very simple. From a small ditch on the hillside, a flume was built towards the ravine, where the mine was opened; the flume gained hight above the ground as the ravine was approached, until finally a "head" or vertical hight of 40 feet was reached. At this point the water was discharged into a barrel, from the bottom of which depended a hose about six inches in diameter, made of common cow hide, and ending in a tin tube, about four feet long, the latter tapering down to a final opening or nozzle of one inch. This was the first hydraulic apparatus in California. Simple in design, dwarfish in size, yet destined to grow out of its insignificance into a giant powerful enough to remove mountains from their foundations. The news spread among the miners, the wonderful practicability of the new invention was at once acknowledged, and, wherever circumstances permitted, a "hydraulic," the name adopted for the novel apparatus, was "rigged."

[The accompanying illustration shows the method of washing, holding the pipe, etc., before the large nozzles now in use were invented.—Eds. Press.]

Improvements suggested themselves from the beginning. The hose, made out of green cow-hide, rotting under the steady exposure to water, became very soon not only offensive, but altogether useless. Some old sailors adopted sailcloth, or heavy canvas, as a substitute; and the sail-maker's trade was called into requisition at every mining camp. How well this canvas hose answered is evidenced by the fact that even now, after a trial of 20 years, it is used to a great extent, particularly in mines to which the transport of iron pipe is inconvenient. With the increasing strength of the material for hose, greater pressure could be applied, and, in some favored places, hydrostatic pressure of a hundred or more feet was created, producing a working power which overwhelmed in a short time, by its own strength, the facilities for its application; or, in other words, absorbed the grade or fall, indispensable to hydraulic mining, in both directions, filling the downward direction, the natural outlet with *debris* or tailings, and leaving in its progress the richest part of the deposit, the bottom, beyond reach.

HYDRAULIC MINING IN THE OLD STYLE.

The same venturous spirit which induced the California miner to rush to fabled Gold Lake, or to Gold Bluff, and later to Frazer river, Idaho, Arizona etc., had led him to seek in the hydraulic process the quick realization of his hopes for great wealth; but when it became evident that *besides* the rich placer, large water-ditches and long tunnels were necessary, requiring both money by the hundred thousand, and time by many years, then the zest for hydraulic mining drooped, and only a few enterprises outlived the reaction. These were carried on generally by men of small means, but of indomitable energy. Many years of anxiety and hardship passed, but the time came when ditches from 25 to 50 miles in length supplied plentiful water, and tunnels, long and deep, carried in endless flow hill and mountain side to the river-beds and valleys below. Success was gained; experience had shown that the larger the scale on which hydraulic mining was carried on, the more profitable the results would be. New inventions were made. Instead of discharging streams of two or three hundred inches against the "bank," a thousand inches of water, about equal to 1,579 cubic feet per minute, were discharged with a velocity of about 140 feet per second. Bank blasts of from five to fifty tons of powder were fired, preparing the ground for the action of water. Splendid results were realized, and hydraulic mining became a favored field for the investment of capital.

(To be Continued.)

*Condensed from an article by Charles Waldeyer, in the last Annual Report of the U. S. Commissioner of Mining Statistics.

The Road to Yosemite is open and in fair condition for the season. Siedig's Hotel, in the valley, will be kept open all winter.

Metallurgy.

[A lecture deltvered before the College of Mines, University of Cal., by G. F. Becker, B. A., Ph. D., graduate of the Royal School of Mines at Berlin.]

Definition of Metallurgy.

The word metallurgy denotes a science end an art. Metallurgicel science is the systematized knowledge of the laws governing the separation of the metals and of the metalloids from their combinations. The aim of metallurgic art is tn accomplish such separations under the conditions prescribed by the science of metallurgy by such methods, that the valne of the element separated (iron, or oopper, or sulphnr, or whatever it may he) shall exceed, and exceed as far as possible the cost of the materials and the processes employed in its isolation. The art of smelting ores is amoug the oldest, and, in so far as it is impossible to treat ores metallurgically without some theory as to what action takes plece, the science of metalnrgy probably vastly outrauks estronomy in ege. The art was practiced throughout the eras of autiquity without receiving any remarkable improvements, and the alchemists of a later dsy were strictly metallurgists, though not very successful ones. Chemistry is, therefore, historically spesking, the daughter of metallurgy, aud a very grateful and nsefu daughter has she proved herself; in fact, the science in its modern sense, has only teken shape since the discovery of the fundamental laws of chemistry gave us also a clue, by means of which we have been able to arrenge such general facts es hed been observed in their appropriate mutual reletions; for though the operations of the chemist are conducted, in hy far the greater proportion of cases, at temperatures hetween the freezing and the boiling points of water, while those of the metallurgist are carried on at temperatures verying from the freezing point tn 4,000° Fah. end more, those laws as to the nature and methods of combination and separetion of substances, which have been discovered at the more convenient temperatures of the laboratory hold good when heet makes iron, or charcoal, or anything that may be exposed to it as white as suow in sunshine, notwithstanding the fact thet the phenomenal results of their action are often so metamorphosed by the differences of circumstance as to he with difficulty referred to their proper categories. The science and the art of metellurgy are therefore hranches of theoretical aud manufacturing chemistry.

Requirements of a Metallurgist.

It thus needs but a definition to show that the metsllurgist ought to he acquainted with the laws of chemical science; but this, by no means completes the sum of his requirements. He must be an acute and practiced observer, aud a quick, and to a certsin extent, original thinker. It is necessary, but not sufficient, that he should be able to recognize the occurrence of certain eets of regular and normal phenomena; that he should know when his slag is right and his metal good. He must he able, so far as study and the cultivation of his acuteness make it possible, to perceive the nature of, and apply the proper remedy to any of the infinite nnmber of abnormal eveuts, from none of which he is safe, and many of which will certeinly occur in his professional experience. If the ordinary analytical chemist finds that some unknown cause has disturbed the reactions he intended to produce, he begins his work afresh with the loss of a little time, end studies out the canses of the disturbance, if he hes curiosity enough, when he is at leisure. But the metallurgist is in quite a different position; he must go on and get the better of whatever is interfering with his work. Perhaps it is an iron blast fnrnace that is in troubte; the iron will not run freely; the slsg is thick and black; the little spy-hole at the outside end of the blast nozzle, instead of being insufferably bright, shows a dull, irrogular patch of light or even none at all. The furnace is chilling! Whet is the trouble? Has the sampling of the ore, or the analysis, or the calculation for the mixture been ill done, or have the men not followed directions in mixing the meterial? Has water got into the furnace, or have accretions on the wells disturbed the desceut of the ore and fuel? Which of a hundred malificent causes are at work? Twenty thoueand dollars or more, and perhaps a reputation, are at stake. The metallurgist is in a more trying predicament than a doctor with a distiuguised patient; for, in the worst event, a sympathetically mournful face and references to an inscrutable Providence, are of no avail whatever to reconcile afflicted blast furnace owners. A last hour strikes for blast furnaces ae well ae men; but old age is the only disease of which they have a right to die. The cause of the trouble *must* be found, and a remedy borrowed or invented and applied. Holes may have to he pierced several yards ahove the hearth, and nozzles for blast introduced there to aid in snetaining the comhustion, or doses of hundreds of pounde of chemicals hlown into the furnace with the air, or any course adopted which the acumen of the metallurgist perceives to he a corrective of the disturhiug oauee. In one way or another a cure must he effected.

Theory and Practice.

Such an instance as I have supposed is sufficient to make it plain that acute observation and ready research are essential in metallurgical art, and these qualities, exieting in men as gifte in different degrees, must in all cases be develped by practice. Observatiou is the strong side of so-called practical men, end it unquestionably exists to the highest degree among those whose sole education has consisted in experience. Such men are also frequently very fertile in resource, but the effectiveness of the combinstion of observation and resource depends strictly npon the breadth and depth of the theoretical knowledge, through which alone, the former can be brought to bear upon the latter. We cau do nothing whatever without a theory. There must be a major es well as a minor premise. When a crow avoids the neighborhood of a gun he must reason. "Hero is a gun; all guns are dangerous; therefore there is danger here," and the proposition all guns are dangerous, is purely theoretical. In the same way a smelter must act on theory, whether he has obtained it from others or deduced it solely from his own experience; but the theory a man derives from his own experience alone is ept to he faulty aud is necessarily meager. It is, among other thiugs, in having the experience of thonsends at his commend that the educated man has the advantage.

Mistakes of Uneducated Men.

It is found that workmen who constantly handle a single class of ores, ettain au estonishing powor of estimating by the eye the quentity of metsl any given heap contains; hut they are occasionally grossly et fault and with a strange ore this power entirely fails them. The observation of the assayer is less sharp; he sees simply thet it is an ore, perhaps a rich or a poor ore, hut his effective resouroe is vastly greater, for he has the whole of chemistry out of which to construct a major premise, instead of some rnle as to a shade of color or the like, on which the workman relies, and consequently he nrrivee at an exact knowledge of the value of the mineral. There are ceses, therefore, when the educated metallurgist really does not need the power of observation, which would be indispensable to one who should be required to make his conclusions without the aid of science. There are other cases where no amount of experience will preserve an ueeducated man (unassisted) from the most disastrous blunders in the treatment of ores. A few years ego a maguificeut looking vein of magnetic iron ore was discovered in western New York. A compauy was formed end a sample of the ore was sent to a well kuown metallurgist. Nothing could look better, hut on enalysis he found that it contained sulphur in microscopic particles to the amount of no less thau 7 per cent., whereas 2 per cent. would have beeu enough to rnin it for smelting purposes. He informed the company that no salcable product could be obtained from the ore; but they had already beguu huilding and were not to he deterred by the judgment of a mere theorist, es they considered him, when the most experieuced practical men, smeltors, doubtless of large and long experience, proounced it a first-class ore. They built two furnaces, worth say $300,000. Their product was rather a matte than iron. It was such hrittle, wretched stuff that it would not eveu answer for wiudow weights. The company naturally failed, but they were hought out by another associetion, which paid a eimilar price for the same experience, and when I last heard of the plant a third company had just purchesed it, with a view to the manufecture of steel! Here was a cese where ordinary experience ntterly failed; while, from a scientific point of view the matter was of the utmost simplicity, and such iustances occur constantly. Many years ago, before the compounding of mixtures on the basis of enelysis was nnderstood, the only method possible in mixing new ores aud fluxes was to rely, in the first place, on the emprical judgmeut of meu of experience, and, after the furnece wss running, to alter a little here and a little there, nntil a good working mixture had been arrived et. Under this system, involving almost invariably great loss of time and material, it not infrequently happened that a furnace wes irretrievably stopped up at every outset, and had to be nearly or quite pulled to pieces before a fresh start could be made. This is a mishap, which could hardly occur to the dullest tyro fresh from the pooreet mining school in existence

Value of Scientific Knowledge.

The value of scientific knowledge in metallurgical operations is beginning to be appreciated. Twenty years ago blast furnace owners in this country and in England very generally turned up their noses at the idea of having a chemist about their works, "to call things by long names and pretend to know more about smelting iron thau men who had made it before he was horn"—and very right they would have been, too, had their idea of the nature and occupation of a chemist been correct, but since then they have seen cause, in such cases as I have instanced, to modify their opinions, and to-day almost every such establishment in England, and in a very large proportion of those in this country, have regularly appointed chemists, and even those who refnse to go so far, resort frequently to analysts for information. Day by day these men are leaving the laboratory for the manager's office, and this must continue to be the case to a greater and greater extent, for the chemists can learn the manager's business, while the managers can scarcely master that of the laboratory.

But there was half a truth in the old fashioned practical man's opinion of chemists and other men imhued with theory, as there commonly is in false opinioue. While natural science is not only of the utmost utility in the arts, but also tende to fit its students, by the cultivatiou of their powers of observation, to excel in technical pursuits; thore is no doubt that a chemist, who is not a metallurgist, would at first fail to see points and differences in the working of metallurgical apparatus, thet are clear to any hoy who has been trundling a slag-buggy in the works for six months, besides lacking the knowledge of machinery construction and administration, which are so essential to the exercise of metallurgic art. The practical smelter immediately detects this, and he may sometimes percelve in such men, or even in metallurgicel students a repulsion to treed the dirty, grimy path, by which alone a thorough knowledge of these matters is to he obtsined, while he is unable to appreciate the value of these seme young fellows' excellent prepsration, in the way of a comprehension of the principles involved, to devclop, with practice, an efficiency surpassiug his own. Of course if they persist in a reluctance to perform this necessary drudgery, they will never become ornaments to their profession or usefnl members of society; but that is no fault of the art and science of metelurgy; lazy and fastidious lawyers and doctors are in the same plight.

There is generally no better way of conviucing the practical man of the value of science, than to give him au opportunity of watching the progross, which an earnest metallurgical student, set to learn any of the numerous trades connected with the profession, will make. Knowing at each step what principles are in eotion, what must be combining, what combinations destroyed and what necessitates each process, he recognises almost every appearance the second time he sees it, end has to be taught scarcely more than the sleight of hand manipulation of tools. He will literally learn in a month what an ordinary green hand will scarcely master in a yeer. The old fashioned man quite appreciates thet, when he sees it. But not only does the student, thus prepared, learn more quickly, he also learns very differently end much more. Nothiug is more difficult for a man who has learned empirically, then to appreciate the relative importance of details. In any one locality the details of a process are of equal importance, in so far es each is necessary to produce the desired result; but some of them are absolute and essential to the process as a process, while others are dependent on purely local conditions. This the student entirely understands, if he has made good use of his opportunities, and his knowlege furnishes him criteria for discriminating between them. So important is this difference between educated and uneducated experience, that it is now pretty generally recoguized, that when a process is to be introduced into a new locality the better plan is, to send trained engineers to study it in its home, and let them effect its translocation and the instruction of the new hands without any importation of skilled labor. This method has proved most successful in this country and in Europe.

Liability to Error.

Instances can be cited without difficulty in which metallurgical engineers heve made great mistakes. I am very sorry that such things occur, but there are unskilful and unconscientious men in other professions than metellurgy, besides which the general fallibility of men has long been a matter of publicity; but I never heerd these facts urged es any very cogent argument against the existence of the other professions. I have heard of a physician of well-earned reputation, mistaking liver-complaint for pneumonia, and the instance might serve as an occasion for one of the usual small jokes directed at doctors; though, as Holmes has recently remarked, the men who make them are the first to howl for the doctor when they get a twinge of the colic. Unluckily, nature has provided no physical index of the sest of suffering for furnace owners, and they frequently labor under a vague feeling that something is not quite es it should be for a long time, much to their detriment, before calling in professional aid.

Superiority of Scientific Metallurgists.

I have given a good many reasons to prove that educated metellurgists *must be* snperior as a class to those who have had the benefit of their own experience only, instead of that of their professional brethren throughout the world. I think I can add valid evidonce that they *are* so. It is frequently asserted that great inventions generally come from uneducated men. How this may be in other branches of industry I will not pretend to say, but it is certain that the changes, which make the metallurgical art of to-day almost a *terra incognita* to those whose conuection with it ceased forty, or even twenty years ago, have been mainly effected by men of thorough scientific training. If in glancing over the field of metallurgy we begin at the border-land between it and mechanical arts, the working up of metal into marketable form, the greatest additiou to our resources, with which we meet in the history of the century, is the steam-hammer. Without it the fabrication of the vast machines now in use for steamships aud other purposes, would be quite impossible; the metallurgist could neither turn out sound masses of metal of sufficient size, nor the machinist forge them into shape without its help. Nasmyth, the inventor, was a member of a highly educated family, and studied at the University of Edinboro. If we turn to improvemente designed to effect a more perfect separation of the metals, the novelties which at once suggest themselves are the crystallization process and the zinc procese for the desilverization of lead. These processes not only enable us to extract at a profit vastly emaller quantities of silver and gold than was formerly possible, but produce an admirable quality of lead. The quality of lead used to depend almost entirely on that of the ore from which it was produced, and the best brands were exported to all parts of the world, but the best of lead can be made almost anywhere now. Pattison, who invented the crystallization process, was assayer and metallurgist by profession. Karsten, to whom we owe the zinc process, was a man of profound learning, and perhaps the most celebrated metallurgist who has lived. In the quantitative production of metels we find the Rachette furnace, which with minor modifications, is decidedly the furnace of the present and probably of the future, for lead and copper-smelting. Its inventor is the engineer in full control of the whole governmental smelting and mining interests of Russia. The Bessemer process has given us steel of a cheapness unknown before, enabling us to manufacture steel rails and other articles of the greatest utility at a very reasonable cost; a single Bessemer retort fifteen or sixteen feet high, will turn out more steel than an eighty-foot blast furnace will produce pig iron. I do not remember ever meeting with an account of Bessemer's education, but I have the best authority for saying that he is a man of large scientific acquirements. Siemens, whose most ingenious apparatus for producing very high temperatures has vastly increased our powers of heating iron end steel, of producing all grades of steel, and of distilling zinc, received as perfect an education, scientific and technical, es the world had to offer.

Economic Consumption of Fuel.

These last inventions bring me to a department which is perhaps of more general interest to the world at large than any other in metallurgy, that of fuel. This is of course common ground for all mankind, but belongs peculierly to the metallurgist, every question relating to its character and compoeition being of the utmost importance to him, and his art claiming for its shere one-third of the whole amount consumed. The progress in the economical consumption of fuel in the last fifty years has been enormous, and has been effected in great pert by metallurgists; and here egain we find the scientific men taking the lead. In the economical application of the heat developed by fuel the Bessemer process is enormously effective, not more than ten pounds of coal being requisite for the production of a hundred weight of steel from pig iron hy this method, while in the older process, still in use for fine qualities of steel, two hundred and fifty pounds are needed. Siemens, by making the heat which would escape through the chimney of an ordinary furnace werm the fuel and the air necessary to combustion, obtains an economy of two-thirds of the weight of fuel. It was Fabor du Faur, an accomplished Bavarian metallurgist, who first made practical use of the gasee which formerly escaped in immense quantities from the tops of blest furnaces and the enormous blast engines, the hoisting engines, pumps and hot blast stoves, often even the roasting kilns of such establishments now-a-days require no fuel except this long neglected waste product. Bischof, another German engineer and metallurgical author, wes the first to produce gas artificially for smelting purposes, and this was certainly one of the greatest advances ever made in our art. By first turning it into gas fuel can be much more perfectly consumed than in the solid form, and hence can he made to give us, as in the Siemens furnece, in which only gas is used, a much higher temperature than is practically attained by the cumbustion of coel in the ordinary way, but perhaps the greatest advantage of gas is that substances, in general scarcely regarded as fuel at all, can be employed for the production of gas with the most brilliant results, a matter of the greatest importance, especially in a region destitute of true coal like California. Lundin, a noted and thoroughly educated Swedish metallurgist, has taught us how to produce gas from wet sawdust entirely without preparatiou, of such power that wrought iron may hs melted with it, and the greet difficulty is to find any material infusible enough to answer as a lining in the furnaces where it is consumed. You will receive some idea of the importance of these improvements from the fact that the economy in fuel effected in Englsnd alone in the year 1872, as compared with, 1871 by the progress made in the introduction of more perfect apparetus, represented more than four millions of tons of coal.

Metallurgy, gentlemen, is not the exclusive concern of any limited class, of those for instance, who have investments in smelting enterprises. It is a metallic age and the value of metals, and consequently the progress made in producing them exercisee a controlling influence on almost every human pursnit. Iron was once more expensive than gold, and the time will come when it will cost but a small fraction of its present price. If our farmers desire cheap railroads, let them hasten that day by encouraging improvements in iron smelting. If our manufacturers and shipbuildera wish to prosper, let them do their best to facilitate the production of iron and copper. If our merchants desire to see increased activity in trade, let them interest themselves in assisting to perfect the art of metallurgy, not of paper making.

I could easily give you more reasons to show how important it is that men engaged in technical pursuite should have the resources of science at their command, and more facte to prove my reasoning correct; hut doubtless it is unnecessary, for all who partake in the onward movement of modern existence not only know but *feel* that the usefulness of every individual, from the drummer hoy to the leader in the battle of civilization, depends on the breadth and the cultivation of hie intelligence.

MECHANICAL PROGRESS.

Better Tools and Implements Wanted.

Did you ever read the story of the "Wonderful one-horse shay?" Do you remember that it was made as strong in one part as another, so that no part could wear out or break *first?* And it run on for a whole generation and descended to children, and children's children as a family heirloom. At last, however, after having run so long without a break or flaw, it came to grief. One Sabbath while on its way to church it reeled, and creaked and fell to atoms, reduced from a wonderful one-horse shay to a pile of dust, and its glory was gone! *Worn out all over alike!*

Well, why can't we have tools and vehicles that will wear alike *all* over now? Why don't manufacturers improve and strengthen the weak points in their wares? Take spades, shovels and hoes, for instance; three-fourths of them at least fail in the shank, or where the handle joins the blade. If you want one stronger in the shank you must buy one that is heavier all over and may be no stronger in the shank than the others. This is wrong and ought to be remedied.

If we look over tools in common use we may find that most of them show a weak point or two where a majority of all breaks occur. These ought to be made stronger in new ones. Such, however, does not seem to be the fact concerning a large number of staple articles. Indeed, many things seem to show more weak points than formerly, and needlessly so too. Implement makers may plead that competition is so sharp and that certain articles are already known in market as standard, that to compete successfully an article must sell as cheaply as the standard one, and the profits are too small for improvement. This is not wholly true; inferior articles even are sold for a superior price, when neatly painted or polished and systematically advertised; and there is no rule of business that forbids the appreciation of merit when properly advanced.

Of course the bulk of manufacturing tools is now done in factories, to the exclusion of home workmanship. Country mechanics complain that they cannot compete with factory prices, and the result is that users of tools buy of dealers who jew both the maker and purchaser, thus covering the weak points of his merchandise on the one hand, and preventing the more general diffusion of tool and implement making on the other.

The bent of inventive ingenuity seems to be adjustibility more than practicability; more of polish than of use. Now, we plead for the useful, and insist that we pay enough now for articles that ought to be more durable. Give us an ounce or two more of metal in the weak points of tools, rather than gaudy paint, and we will be better satisfied. Let us insist that the weak points be strengthened in tools, implements, vehicles and machines; and above all let us have simplicity of construction. —*Cor. Germantown Telegraph.*

FIRE-PROOF COLORS.—Dr. Kosch, of the Chemical and Technological School at Vienna, has made an interesting discovery, which consists in the fact that certain colors may be made fire-proof, and may thus be made for painting on china in precisely the tones required. The inventor has prepared a palette on which his colored enamels may be used like ordinary oil colors, and may be painted in every conceivable combination of tints without being in the slightest way altered by the action of fire. Dr. Kosch at the same time makes use of a specially prepared enamel, which he spreads over the surface to be painted on, and by which the irregularities and porosities of the porcelain are so thoroughly concealed from view as if they were covered with thin smooth fine linen. The importance of such a surface medium will be fully understood by all who are practically conversant with the difficulty of preventing the irregular and undue absorption of color which has hitherto stood in the way of producing artistic and carefully-toned effects of color on porcelain. Another and scarcely less interesting invention for which Austrian art is indebted to Dr. Kosch, is the fusion of gold, silver and platinum with bronze, by which the most gorgeous effects are produced.

SUCCESS OF STEAM CANAL BOATS.—The thirteen steam canal-boats put into service on the New York and Erie Canal appear to be doing their work satisfactorily, one of them recently reached Buffalo from New York with a load of merchandise, in six days, seventeen hours. This is considered good time. The Baxter Company have contracted for ten more boats of the same pattern—a fact which shows that they are regarded as an improvement over the horse boats. The freight rates are very low, but notwithstanding this it is said the new boats make money.

FIXING SLATES.—Slates, instead of being nailed to the roof, may be fastened by movable hooks about two inches long, which are soldered to conically-formed zinc plates, four to six inches long. The slates are thus kept securely between the hook and zinc plate and can be removed simply with the greatest facility, by turning the hook. Thus one or more of the slates can be taken out for repair or new ones inserted without interfering with the rest. The method is said to make a roof water-tight.—*Scientific American.*

Tool for Riveting Boiler Tubes.

La Metallurgie publishes a description of a tube riveting tool invented by M. Jouffret, engineer of the Donbas and South Eastern railway of France, and for which a medal was awarded by the Society of Industrial Sciences of Lyons. M. Jouffret, like many other engineers, recognized the difficulties and imperfections of the usual methods of riveting boiler tubes, and especially the fact that the effect of the hammer or other tool was often to shake a joint which had already been made and supposed to be perfect.

The apparatus in question consists of three steel runners or wheels, the peripheries of which are turned concave of the form desired to be given to the edge of the tube; these wheels are attached to a stock, of which the parts are so arranged that the runners can be set to any sized tube by the action of a screw and nut. The tube is placed in position in the plate, with its end projecting from seven to eight millimetres, more or less, according to the circumstances of the case. If a ferrule is to be inserted in the end of the tube, this is also fixed in its place; if not, a mandril supplies its place during the action of the tool. Thus the runners are equi-distant, and tangential to the ring or mandril. All the parts being in position, the tool is caused to revolve around a central arbor, and the runners pressing heavily on the protruded end of the tube, rivet it completely and regularly all round, while neither the plate nor the tube being submitted to any shock, there is no distortion, and no disturbance of the riveting when once effected.

The inventor says that the work is done more rapidly by the new tool than by the old method; that an end is riveted by it in five minutes by the former, while the old method occupies from seven to eight minutes. Unfortunately, the tool is not applicable to the riveting of the tubes in the angles of locomotive boilers, but it is observed that these are subjected to the least wear. It is available for the central mass of tubes, and for the lower range, which are acted on directly by the fire, and which consequently should be rivited with the greatest possible care, especially in boilers, such as those of locomotives, in which the tubes act, to a certain extent, as ties between the tube plates and the smoke box. The tool is said not to be very expensive.

Nine Reasons for Iron Structures.

In a paper recently presented to the American Institute, the following nine reasons were given for the use of iron buildings:

1. The great facility with which any architectural design may be carried out in iron.

2. The great economy of space that may, if necessary, be obtained; inasmuch as a much thinner wall of iron may be stronger than any stone wall now constructed. A cast-iron column, made of iron of only ordinary hardness, would rise to the bight of several miles before its own weight would crush it. With such enormous strength there need only be employed skill and knowledge by the constructor to render an iron building beyond all comparison the strongest that can be made.

3. Economy in the construction of foundations, usually so expensive a part of the builder's work, and safety of the building, notwithstanding the foundation may be imperfect. We should not advocate or countenance carelessness; but every man is aware how many unlooked for casualties happen to a foundation, often disastrous in their results to the superstructure. The advantage gained by the use of iron for the building, in this regard, lies herein; that if part of the foundation, notwithstanding all care used, shall give way, the superstructure will be still unharmed.

4. A not unimportant consideration in cities If at any time the owner wish to move his building he may do so, being only at the expense of the actual removal, and having his entire house in as good condition as when first made, losing nothing of the material.

5. Security against lightning—the electricity being diffused over a large surface and thus losing all its intensity.

6. Facility of ventilation.

7. The impervious nature the material preventing dampness and mildew and consequent decay.

8. Its durability, outlasting all the stone that ever was quarried.

Lastly. Its incombustibility. All public buildings and such private buildings as are used for the storage of valuable goods or works of art, should have the interior at least constructed with a view to the prevention af fires. Without the aid of iron this is impossible.

IRON AS A WOOD PRESERVER.—According to Hubert, the best means of protecting wood which is exposed to moisture, especially railroad ties, is to drive into them long, fine iron nails, with broad and flat heads. When wood thus protected is placed in the ground the nails rust, and the rust spreads equally throughout the wood protecting it. The ties may also be wound with iron wire. Hubert states that wood treated this way has been buried in moist earth and remained sound for nearly fifteen years.

SCREW VS. PADDLE.—During the past ten years the screw has entirely replaced the paddle in trans-Atlantic navigation, the weight of marine engines has diminished one-half, the steam pressure has quadrupled, and the consumption of coal has decreased two-thirds.

LINING METAL TUBES.—An ingenious method of lining a tube of one kind of metal with another of a more fusible nature, consists in first thoroughly cleaning the interior of the tube and plugging it up at both ends, and then fitting it into a lathe or other apparatus, by means of which a very rapid rotary motion in a horizontal position may be given to it. Through one of the plugs a sufficient quantity of the second or softer metal, which is to form the desired lining, is introduced in a melted state, a pan of ignited coals or a gas-burning apparatus being placed under the tube, extending along its whole length and at a proper distance so as to keep the metal in that condition, while a rapid rotary of the tube is established. The melted metal is thus diffused uniformly around the interior of the tube, and by removing the pan of coals while the rotation is still continued, the temperature is gradually reduced and the interior metal hardens, forming a permanent lining.—*Exchange.*

A FIRE-EXTINGUISHER FOR SHIP-BOARD.—A fire-extinguisher at sea, which will perform its work efficiently, has long been a desideratum with the owners of vessels. Messrs. Paton & Harris, of Glasgow, believe that they have succeeded in supplying this want by their "Pyroleter, or fire destroyer," a contrivance by means of which the hold of a 1,200-ton ship can be filled with an anti-combustion gas in less than twenty minutes. The gas—carbonic acid—is prepared on deck by means of a light, portable force pump, and the compound is forced through a tube to the bottom of the ship's hold. In the "separator," which is fixed to the keelson, the gas is set free to do its work by expelling the lighter common air through apertures in the deck, which have been left open for its escape.

THE Pullman Car Works, at Detroit, have recently shipped to England nine palace cars to be used on the railways there. A number of workmen go out with them to put them together, as they are necessarily shipped in pieces.

SCIENTIFIC PROGRESS.

Professor Henry and Tyndall In Collision.

When Professor Tyndall enters again the fields of scientific inquiry, he will find them as rich and exhaustless as ever, and will receive a welcome from his collaborators such as his previous service justly merits. Among the first questions that will command his attention is that which so lately received his endorsement, namely, "the effect of a mixed atmosphere on the progress of sound waves." will be remembered by our readers that, as the result of a series of experiments with various fog-signals. Professor Tyndall advanced the theory that the sound given forth by these instruments was often intsrrupted, and at times entirely dissipated by the absence of homogenity in the atmosphere. Thus, on a cloudy day, the sound might be plainly heard; but if the sun was to come out, that heat would cause an evaporation from the surface of the water, and a consequent change in the constitution of the atmosphere above, which would result in an interference in the sound-waves; and hence what he calls "sound-darkness" would ensue.

In a paper read before the American Association, Professor Henry called in question the correctness of Professor Tyndall's deductions, and advanced the theory that the phenomena noticed by the latter were due, not to the absorption of sound, but its refraction by wind and other causes. The main argument against Professor Tyndall's views is based on the opinion that that the absorption of sound by a mixed atmosphere must be inconsiderable compared to the volume of sound given forth. This is illustrated in the case of the steam-siren: so intense is the sound given forth by this instrument, that it would cause sand to dance on a stretched membrane at a distance of one and a half miles, while a twenty-five hundred pound bell would not cause the same result at a distance of ninety feet. As proving the refractory power of the wind, it is stated that, with the wind blowing directly against the sound, an instrument that could be heard on a quiet day twenty-five miles is reduced in penetrating power to two miles. Professor Henry credits Mr. Stokes with having first given a hint of the true explanation of this fact, in respect to the reflection of sound by winds, and effect due to the change caused by the wind in the direction of the waves, so that the sound is carried upward. As illustrating this reflecting power of the waves, Professor Henry credits the echoes occasionally heard at the sea to this cause, while Professor Tyndall thinks them due to the reflection-surfaces of the wind. When authorities so eminent are found at variance upon such a subject, we who listen may expect to learn much, whatever be the finally accepted theory.—*Appletons's Journal.*

TEMPERATURE OF THE SUN.—M. J. Violle described to the French Academy of Science his apparatus and methods, and concludes that the temperature of the sun at Grenoble, on June 20th, at 3:30 P. M., was 1,354 degs. Concerning the above researches of M. Violle, H. Saint-Claire Deville remarks that it is not prudent to speak of temperatures above those which have been measured, the highest of which probably has been determined by the experiments of Bunsen. In speaking of calorific phenomena produced by combination we must remember that, in given conditions of temperature and pressure, the quantities of matter which combine, and consequently the amount of heat produced, are limited by the phenomenon of constant dissociation—a limit which the speaker's experiments place very near to measurable temperatures. It is, therefore, not permissable, until the contrary has been demonstrated, to speak of those fabulous temperatures which have often been mentioned.

Important Fossil Discoveries.

The discoveries of fossils in the interior of the American continent appear to be adding more largely to paleontological science than any other portion of the globe. Every expedition into the great unknown wastes on either side of the Rocky mountains adds largely to our knowledge of ancient and extinct life, and are beginning to point out the necessity for important changes in some of our conjectures with regard to the age of some of the early animals upon this continent. These discoveries are duly appreciated both at home and abroad. Last year, says the Denver *News*, it will be remembered, that Prof. Cope set the scientific world on fire by the discovery of an "elephant's graveyard," containing the bones of mammoths, and the extinct elephantine genera, and this year again he is likely to cause a similar mundane conflagration by an even more extensive discovery of the same sort. In conjunction with his coadjutor, Dr. Yarrow, he has unearthed in the valley of the San Juan a large number of vertebrates of enormous size, some of which are entirely new to science, and those that are not, of a very rare and comparatively unknown species. Among them are several very perfect skeletons of the mastodon race, and a very large variety of mammoths cousin German to that elephant of the past. The discovery has not yet been arranged and classified, so that a complete list of the different specimens embraced in it cannot be given; but this work already is in progress; a number of the specimens having been forwarded to Washington soon after their discovery, where competent persons at once set to work upon them, and Dr. Yarrow recently left Denver for the East with a large proportion of the remainder.

Besides this very valuable variety of vertebrates, as many as a hundred additions to the known list of invertebrates have been made, while also a large number of "old friends with new faces" have been found; in other words, familiar specimens have been discovered in entirely new formations. The effect of this latter will be to revolutionize many of the conjectures of science, not only as to the age of the animals in question, but also as to that of the formations they are found in. The entire discovery, taken as a whole, Lieutenant Wheeler regards as the most valuable contribution to pale ontology made since that study became a branch of scientific research.

The natural division of the survey under Dr. Rothrock, the well known botanist, has achieved substantial success. An immense number of specimens of mammals, reptilee and fishes, and as many as 1,000 bird skins, some of them new varieties, were obtained. Of the fishes, five of the species discovered are entirely new.

The Nationality of "Old Probabilities."

Professor Abbé in a late number of the *Silliman's Journal*, gives his reasons for believing that weather telegraphy had its origin in the United States—that "Old Probabilities" was a Yankee by birth. This article has drawn the following communication from Dr. Vanderweyde, in which he states that "Severrier in France, in 1854, called attention to the importance of systematic weather reports, and that in 1863 a system of daily probabilities was inaugurated in that country, further, that Professor Redfield wrote in 1846 to *Silliman's Journal* that gales might be predicted with the help of the telegraph, and lastly that the Weather Bureau was inaugurated in the United States in 1864. These statements are undoubtedly correct, but as the article is intended as an argument concerning the honors of priority in this regard, it may be well to make a few statements of facts within my personal knowledge, the correctness of which I can prove by published documents.

Professor Buys Ballot, of Utrecht, Holland, after having for years made meteorological observations with a view to obtain probabilities, established simultaneous observations at fixed days and hours all over Holland and neighboring localities, with help of voluntary correspondents of whom the subscriber was one.

Later, the system was extended, and the established telegraph companies aided liberally in transmitting the weather reports, while Professor Buys Ballot urged, during a period of 14 years, the government of Holland to publish them officially and to organize a weather bureau, which was finally done May 21st, 1860. England followed suit in February, 1861; France in August, 1863; and the United States intended to do so in 1865, when the destruction of the Smithonian Institution, which was to be the head-quarters of the enterprise, caused a postponement."

If "Old Probabilities" is after all a Dutchman, neither France nor the United States should dispute his paternity. Seven cities, we are told, claimed to be the birth-place of Homer, and it is impossible to determine which of them is entitled to the honor; but in this case a careful sifting of facts and dates will of course settle the question.

The Rain.

Winter hss sst in in sarnest. The vsry heavy rain that began to fall on Sunday was general all over ths State. Hsre, in San Francisco, csllars havs bsen flooded, sswers burst, and considershle damags dons. According to the report of the United States Signsl Servics obsersor, in this city, dnring the 24 hours preceding 8 P. M., Monday, thsre wss a rainfall of 4.70 inches. Ths rsport of Chss. G. Ewing, of this city, makes a total for ths storm of 3 30 inches, or 4.56 inchss for Novsmbsr up to 8 P. M. on Monday. From July 1st to Nov. 1st, ths fall wss 2.89 inchss, and according to some authority, the rsinfsll in this city for this yssr is 7.45 inches. The hsaviest rain yst recorded for November in this city, was that in 1849--8.66 inches.

In ths intsrior the rain has bsen gensrsl. At Yreka it has been raining and storming; at Shasta, 7.75 inches fell during the storm, making a total of 14.12 inches for ths month, and 20 inches for ths season. At Chico, 3 94 inches fsll up to 6 P. M., on Mondsy. At Colfax it rained hard and slso at Orovills. At Msrysville. 2.07 inches fsll in 24 hours. At Napa, np to 10 A. M. on Monday, 1.57 inchss of rain fell. At Ssnta Rosa, since Saturday 2.50 inches fell. Ukiah, raining; Stockton hsd 1.66 inches up to 4 P. M. on Monday, msking 4.17 inchss for ths season. At Pittsbnrgh Lsnding 1¼ inches fsll. At Antioch thsy had two inches, making a total for ths season of 2.56 inchs. It also rained hard at Martinez, Mercsd, Modssto, Lsthrop, Salinas, Watsonvills, and San Luis Obispo. It rsined hsrd at Alta and all stations west of Sacramento.

We annsx a tshls ahowing ths monthly rainfsll at Sscramento since 1849, prsparsd by Dr. Logsn, Secretary of ths Stats Bosrd of Health:

Arranged according to the seasons, showing the amount in inches of each month, during twenty-six years, and for each rainy season, to November 1st, 1874; also the quantity for every month, and the annual amount of rain.

RAIN TABLE FOR SACRAMENTO.—PREPARED BY DR. T. M. LOGAN.—For the Press.

Mining Stocks.

There have been no fsaturss of particular interest in the stock market this wssk. Prices have fluctustsd as usual, with no very important changss. Cousidersbls business is being dons in all classss of stocks, those on the Comstock in particular. The *Enterprise* speaks vsry hopefully of future prospects in that section, and surely some of ths miners thers are doing wonderfully wsll. That papsr ssys: "Whils stocks havs besn strong in ths markst, ths mines havs been gaining in wealth on ths lowsr levels. Particularly has this hssn ths cass in ths north snd of the lesd, whsre, at ths prsssnt momsnt, liss the main strength of ths Comstock. This fact must now bs patent to all who ars at all convsrsant with ths mining sitnation. In ths Consolidated Virginis mins alone the experts sstimate that thsrs is now in sight, in ths ors hodiss opened up in ths seversl levsls, ore to ths vslus of not lsss than $30,000,000; and ss yet thsy appesr to he only hsginning to make ths acqusintance of their mins. Well may this mins he designated as the "Heart of ths Comstock." What slse can it he, whsn on the 1,500-ft. level a drift hss been run across the vein to the distance of 162 feet withent reaching the limit of the ore in either direction? Not at this point alone are found indications of the vast extent and strength of the grsat mass of ore--which sppears to rise up in the ssrth like a mountain psak struggling its way to the surfsce—hut it is the sams wherever explorations are made. In the California mins, when it shall havs been prosrly opened, will be found the same monntain ridge of ore bearing away to the northward, into and through the Ophir, for the companies working thsse mines have opened them on a new line. They are now to the eastward of the "pinch" or fault which cnt off the old Ophir and other adjoining minss, and have opened upon the vein at a point where it holds its true and undisturbed conrse. * * * We now have ssveral companies that are struggling through "faults," but all of thsse that evsr had ore will have ore again—it is only a matisr of time and patience. Lsaving thess struggling companies ont of the count—there always have been aome companies thns strnggling and always will be—thers is to-day more ors in sight along ths Comstock, and largsr and richsr bodies than ever before in the history of ths lode.

Thnrsday heing Thanksgiving day thers was no session of the Bosrd.

New Incorporations.

The following companies have filed certificates of incorporation in tbe County Clerk's Office, San Francisco:

Leopold M. Co.—Nov. 19. Location: Cornucopia District, Elko, Nevada. Directors M. J. McDonald, A. H. Webb, L. J. Hart, E. G. DeCrano and L. Witacy. Capital stock $5,000,000.

Electric Medical Society of the State of California.—Nov. 20. Tbe purpose of the corporation is the advancement and culture of the science and art of medicine and surgery upon the principle of electricism. Directors—C. P. Warren, M. R. Tewksbury, F. C. Cook, J. P. Backesto, C. F. Draper, B. Sterman, S. Clark and L. B. Hoag.

Atlantic and Pacific Q. M. Co.—Nov. 20. Location: Lake county, Cal. Directors—S. C. Field, Dwight K. Tripp, G. D. Field, W. Leffingwell and C. C. Hallett. Capital stock $4,500,000, divided into 45,000 sharea.

Kearsarge Con. Q. M. Co.—Nov. 21. Location: Lake Mining District, Lake county, Cal. Directors—J. C. Hanscom, R. N. Van Brunt, W. G. Hughes, J. E. de la Montagnie and C. T. Armstrong. Capital stock $5,000,000, divided into 50 000 sbares.

Wide West G. and S. M. Co.—Nov. 21. Location: Napa and Sonoma counties. Directors—J. C. Hanscom, G. M. Pinney, C. N. Van Brunt, J. E. de la Montagnie and R. M. Wilson. Capital stock $5,000,000, divided into 50,000 shares.

Tbe following companies have filed certificates of incorporation in the office of the Secretary of State, at Sacramento.

Searsville and La Honda Turnpike Co.—Object: To build a turnpike between the above points; place of business, Redwood City; capitnl atock, $10,000, in 100 shares of $100 each. Directors—S. B. Emerson, R. J. Weeks, A. T. McClure, C. N. Fox, J. Hilton.

Atlantic and Pacific Q. M. Co.—Location: Lake county. Capital atock $4,500,000, in 45,000 sharea of $100 each. Directors—S. C. Field, D. K. Tripp, G. D. Field, W. Leffingwell, C. C. Hallett.

Cross-Cut No. 2, which is 100 fect south of the shaft, on the 1,500-foot lsvsl of ths Consolidated Virginia mine, has penstrated the ore body 162 fsst from east to west, without cutting sither the east or west walls.

Charles Forman has bssn appointed superintendent of ths Ovsrman mine, in place of J. W. Myrick, who was obliged to resign on account of ill health.

Sales at the S. F. Stock Exchange.

Wednesday, Nov. 25.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALAMEDA COUNTY.

Livermore Coal Mines.—Livermore *Enterprise*, Nov. 21: The main shaft is down 200 ft., and from this point a drift hss been run south, 150 ft., passing through sevsral strata of fair coal, ranging from four to 16 inches in thickness. At ths snd of ths 150-ft. drift a lateral drift has been run due east 25 ft., cutting through several seams of coal. It is anticipated hy the supsrintsndent that within another 25 ft. ths main bsd of coal will be struck. Thers are now nins men at work in ths mine, but jnst as soon as the main bed is found s largs force will be put on and the compsny will supply tho local markst.

AMADOR COUNTY.

Splendid Prospect.—Ths Butts Mountain Co., nnder ths superintendence of Mr. George Kelton, hsve been engaged for soms months past in rnnning a tunnsl nnder the Butts monntain. The first tunnsl waa drivsn in several hundred feet, but, after cntting ths rim, ths bed rock pitched rapidly as advances were made, and the workmen had to cease work in the first tnnnel on account of wstsr. Fsiling in ths first tunnel, snd having fsith thst treasnrs worth seeking lay hid nnder ths old mountsin, Mr. Kelton determined to try another point, and therefors started a second tunnel, abont 200 yards sast of the old one, and after driving it in 160 ft. struck the rim of the hasin that underlies the mountain, and, on passing ths rim, gravel was strnck, apparsntly the beginning of a regnlar deposit. Mr. J. Nichols who has been working in the tnnnel, exhibited to ns the resnlt of the washing from a single pan of dirt taken from the end of ths new tunnel, the gold washed from the pan of dirt being of the value of $1. The gold is coarse and snch in character as is found in channels.

CALAVERAS COUNTY.

In Good Luck.—Calavsras *Citizen*, Nov. 21: For some weeks past Mr. G. Osborne has hsen taking gold out of his Gold Hill claim, on Smith'a flat, near Altavills, hy the hnndreds of dollara. We are glad the gentleman is meeting with snccess, as hs is an old asttlsr, and has heen working the mine a long time.

Mining Items.—Calaveras *Chronicle*, Nov. 21: Veitch & Co., owners of the tnnnel ridge, (hydraulic), are also piping hottom prsparatory to msking a general clean-up hefore commencing their winter's run.

MOSER, of the Spring Gulch sluicing claim, is working at intervale, waiting for rain to swell the volume of water in the gulch before putting in his best "licks."

COOK & Co., the indefatigable, are never idle, never cease active operations under any circumstances. They are washing away, have been and will be so long as a head of water and sluice-box is to be had.

EMERSON, chief engineer of the Happy Valley claim, has a few lengths of flume to lay yet, and then he will turn a stream against his bank.

WEST POINT DISTRICT.—The completion of the Enterprise Consolidated mill is being hurried on with all possible dispatch. The superintendent intends to have the mill in running order by the middle of next month, in spite of the now frequent storms. Work on the mine has been resumed. A complete change in the management of the Zacatero is progressing. Lone Star extracting fair milling ore. Josephine continues to look very well. The recent storms have retarded progress considerably.

EL DORADO COUNTY.

MINING.—Most of the mines on the north side seem to be unremunerative at present, but all parties interested feel hopeful, even confident, that a change will soon take place, and that most of them will be paying good dividends. A great deal of dead work has been and is now being done to get the mines in proper shape for more economical working, and we think that section will soon be able to make a better showing than at any time for a number of years.

LAKE COUNTY.

HOLLY HILL MINE.—Lake Co. *Bee*, Nov. 21: We visited the Holly Hill (formerly the Big Indian) mine, seven miles from Middletown, last Saturday. They have a tunnel opened 50 ft., and are now blasting through rock which shows evidences of cinnabar. P. M. Daly is superintendent of this mine.

MARIPOSA COUNTY.

THE MARIPOSA LAND AND MINING COMPANY.—Mariposa *Gazette*, Nov. 20: Mining operations have been resumed on the Mariposa estate under the recently incorporated Mariposa Land and Mining company. Mr. Burr, the new manager, appears to have the confidence of the people of Bear valley, to whom the payment of cash to employees every Saturday night is a novelty. The work at present is confined to the running of the tunnel at Benton Mills, which gives employment to twelve men. Some necessary repairs will soon be made on the dam—that structure being in a shaky condition.

NAPA COUNTY.

THE LANGLEY MINE.—*Napa Reporter*, Nov. 21: On Monday last the miners at work on this mine were, for some reason not given, discharged. The superintendent, also, went down to San Francisco. The miners speak well of the mine, and the supposition is that it is either going to change hands, or that the owners are satisfied with the prospect, and are going to make arrangements to work it in some other way.

MORE SILVER.—Partiee prospecting in the mountains above and around Knoxville have discovered as good indications of silver-bearing ledge as are presented at the mines of Mt. St. Helena.

MINING RECORDER.—The election at Calistoga, for mining recorder, resulted in the election of Mr. E. E. Stacy.

A COAL STRIKE.—Indications of coal have been discovered for years past at the base of the mountain near Sulphur creek, back of St. Helena, but, until recently, no discovery of any workable vein had been made. Recently, however, a prospecter has come across a vein of coal five feet wide, at the opposite foot of the mountain, in a little vale called Gibbe' valley. It is the intention to make a thorough examination of the vein immediately, and, if it prove satisfactory, work will be commenced upon its thorough development.

THE PENOBSCOT.—F. W. Bean is the superintendent of the mine thus known, situated near the Geyser road, between the Missouri and the Geyser springs. He informs us that a Knox & Oeborn furnace will shortly be commenced upon at the mine, which can show some of the richest cinnabar to be found in the district.

NEVADA COUNTY.

THE MEDA MINING COMPANY.—Grass Valley *Union*, Nov. 21: The location of this company is on the dividing ridge between the North Fork of the American and Bear river, three miles below Colfax. The ledge was taken up a number of years ago under the name of the Live Oak. It has been idle for a long time, but the company has reorganized under the name of Meda. A tunnel has been driven in 250 ft., and the ledge, which is a strong one, is expected to be struck within 20 ft. The tunnel will strike the ledge at sufficient depth to give a great amount of backs, which will permit of the quartz being taken down easily and cheaply.

DISTURBANCE.—Foothill *Tidings*, Nov. 21: Trouble is likely to grow out of the introduction of Chinese labor to the mines here. Several shots have been fired into and about the works of the New York Hill mine; one on Monday night last. No other cause can be assigned for these acts than the fact that Chinamen are employed underground in this mine. Much as we deprecate the step taken by the owners of this mine—as likely to lead to a still more extended employment of these creatures, where not necessity, but the greed of gain, alone prompts thereto—we must decry against these unlawful acts, not only because likely to bring punishment upon the perpetrators, and discredit upon those in whose interest performed, but sure to strengthen the resolution of those inclined to the cheap labor system for mines. There are other ways of discountenancing this usurpation—means quite as effective, and not criminal or unlawful.

PLACER COUNTY.

IRON.—Placer *Herald*, Nov. 21: We doubt much whether there are better iron mines in the world than we have within a few miles of Auburn. Our iron beds seem to be inexhaustible, the ore of good quality, the mines easy of access, and convenient to the great trans-continental railway; still they are not worked. We have the cheapest fuel in the country, near at hand, and everything else, so far as we know, essential to the establishment of first-class smelting works. One of the grand features of Placer's future will be her iron mines, and the sooner they are opened the better. We know no better chance for the investment of capital, and why some efforts are not made to direct it to these iron beds, is one of the unaccountables.

SIERRA COUNTY.

BEUSH CREEK.—Mountain *Messenger*, Nov. 21: We learn that a tunnel has been commenced on the Woodruff creek side of the ridge, at the Mountain House, which is calculated to strike the Brush creek ledge considerably lower than the bottom of the shaft in the mine. The richest quartz ever taken out in this county came from here.

GREEN MOUNTAIN.—The ditch to convey water from Rock creek to the Green mountain hydraulic claim is completed, or will be in a day or two. The company have 400 feet of 18-inch pipe on the way up from below, and have a "monitor" ordered. The lumber for flumes and sluices will be on the ground in a day or two, the weather permitting. The company will have a pressure of 150 to 200 feet, which it is expected will be ample, although the ground is very hard. Gravel of the same character is successfully worked at the City of Six, by McNaughton, with less fall.

EUREKA.—The hoye at Eureka are at work in their diggings, closing up this season's, and getting ready for next season'e operations. Scott & Crooks are opening some mining claims just below the Butcha and Marietown trail, a short distance above Little Cañon creek. The early storms prevented their getting in timbers, thus delaying the prosecution of the work until another season.

TUOLUMNE COUNTY.

STAUCK IT.—*Tuolumne Independent*, Nov. 21: Springfield. Potter & Co. have found a fine prospect in their quartz ledge on the Columbia road, east of Springfield. The rock is very loose and of a rotten quality, and will pulverize under the forces of the arrastra.

GRAVEL MINING.—*Union Democrat*, Nov. 21: Work is progressing lively in the Kincaid Flat claim, where a hydraulic is constantly tearing into the huge banks. At the claim in Sullivan's Dry Arroya there are two hydraulic pipes engaged. Soon as the flume that conducted water to the old Rough and Ready claim in Table mountain, can be replaced by a pipe, hydraulic washing will be resumed there. These claims are all under the superintendence of James T. Macleau, Esq., who is making everything tell since the abundant supply of water came.

QUITE a number of claims on the recently discovered quicksilver vein, near Relief valley, in the mountains east of this place, have been recorded here this week.

Nevada.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—Gold Hill *News*, Nov. 19: The ore breast on the 1300, 1400 and 1500-ft. levels, are all yielding rich ore, and never looked more promising than at the present time. The face of both the north drifts on the 1300 and 1400-ft. levels, running northward toward the California line, are still in fine ore. Three winzes are being sunk, one from the 1200-ft. level, to connect with the north drift on the 1300-ft. level, one from the 1300 to connect with the north drift on the 1400-ft level, and one from the 1400 to connect with the north drift on the 1500-ft. level. These winzes are all in fine ore, are being sunk for air purposes, and are situated 100 ft. farther northward than the line of north winze No. 2, spoken of in our previous report. Cross-cut No. 2, 100 ft. south of the shaft on the 1500-ft level.

OPHIR.—The mine is looking splendidly throughout, and never gave more flattering promises of still greater developments on the 1700-ft. level than now. Sinking the winze in cross-cut No. 2, on the 1300-ft. level, is still going steadily on, the bottom still in rich ore.

SIERRA NEVADA.—Daily yield, 65 tons of ore, keeping the mill steadily running. The ore breasts in the old upper workings are still furnishing a good supply of ore, while the breasts being opened out on the ore body in the north drift from the Sierra Nevada tunnel are improving daily as the developments progress.

SAVAGE.—Sinking the main incline below the 2100-ft. level is making good headway, the bottom in good working ground. Sinking the winze below the 2000-ft. level is also making good progress.

IMPERIAL-EMPIRE.—Sinking the north and south winzes, on the 1850-ft. level, is making the usual good headway, the bottom of both still in fine ore.

OCCIDENTAL.—Sinking the winze from the upper level to meet the upraise from the lower tunnel is going steadily on without change of interest to report.

DAYTON.—Daily yield 70 tons of ore. The ore breasts south, on the second station level are yielding finely. The turn-table stopes on the third station level, are also improving in the quality of ore extracted. Two cross-cuts have been made from the north drift on the second station level near the Cherokee line, one east and the other west, which show the ledge to be 70 ft. in width, without yet reaching the west clay wall.

JULIA.—The new and powerful pumping engine was started up two days ago and found to work with the utmost smoothness and perfection. The pumps are all in place and everything in readiness to commence draining the water from the lower levels of the mine.

HALE AND NORCROSS.—Sinking the main incline below the 2,100-ft level is making good progress. The face of the main west drift from the 2,100-ft. station is in ledge matter, but has not yet encountered any pay ore. Sinking the north winze below the 2,000-ft. level is making good progress.

BELCHER.—Daily yield, 500 tons of ore. There is no change whatever to report of the condition of the ore breast in any portion of the mine. The mills are kept steadily running.

WOODVILLE.—The new ore body on the 300-ft. level, discovered last week is still improving as it extends to the southward. The ore stopes on both the 200 and 300-ft. levels are yielding finely, in fact, the entire mine is looking well throughout. The mill is kept steadily running on ore from the mine and is doing fine work.

CROWN POINT.—Daily yield, 500 ton of ore. The ore breasts on the 1,300, 1,400 and 1,500-ft. levels are yielding finely.

SUTRO TUNNEL.—The work in the header goes ahead as usual. Rock softer, with seams of clay and occasional streaks of quartz. No water. J. R. Johnson, Accountant; D. J. Bonsfield, Cashier, and I. Bluett, Foreman of the Sutro Tunnel Company, have resigned their respective positions. A. B. Johnson has been appointed Assistant General Superintendent.

CALEDONIA.—A drift east has been started from the 1,076-ft. station to cut and prospect the ledge. The usual amount of prospecting is being vigorously prosecuted on the 900-ft. level.

OVERMAN.—The pumps are all in, ready to open the 1,400-ft. level station, which will be commenced in a few days more.

YELLOW JACKET.—The cross-cut from the main incline on the 1,740-ft. level is still pushed ahead to prospect the ore vein at that point.

[illegible] of the west drift on the 400-ft. level is in much softer ground. There is a strong flow of water and a prospect of a better ore development ahead. The body of ore in the face of the north drift on this level is 14 ft. in width, but of low grade ore.

BULLION.—The south drift on the 800-ft. level, running toward the Exchequer ground, is being pushed ahead through promising ledge material. The north drift from the Imperial shaft on the 1,700-ft. level is making good progress, with good prospects of ore developments ahead.

LEO.—Fair progress continues to be made in driving the main tunnel ahead. The ore vein is about a foot wide, and the indications are that it will continue to widen as the rock becomes softer.

LADY BRYAN.—The new pumping machinery was completed and went into full operation on Sunday morning last. Sinking the main shaft will be resumed immediately.

KNICKERBOCKER.—The face of the west drift, on the 700-ft. level, is still in hard blasting ground. The main west drift, on the 700-ft. level, is also in hard blasting rock.

CHOLLAR-POTOSI.—Daily yield, 60 tons of ore, from the old upper workings. Bullion shipped during the week, $4,927.

GOULD & CURRY.—Sinking the north winze from the 1,500-ft. level to connect with the north drift on the 1,700-ft. level is making steady progress.

SUTRO.—The main west drift is making good progress to the westward, the face still in ledge matter with occasional spots and bunches of quartz.

TYLER.—The pumping machinery has been again put in operation to drain the mine. This is now almost accomplished.

BALTIMORE CON.—Sinking the shaft is progressing finely. The cross-cut from the north drift on the 400-ft. level is showing some very favorable indications of ore. The cross-cut on the 750-ft. level is also looking much more promising.

JUSTICE.—Prospecting from the old Waller shaft is progressing finely, with some prospects of good ore developments ahead.

DARDANELLES.—The drift for the ledge from the bottom of the new shaft progresses very favorably in the hard rock.

NEVADA.—Good milling ore is being extracted from the upper level.

INDUS.—The incline below the tunnel level is being driven downward through fine ore.

Arizona.

MINES AND MINING.—*Arizona Miner*, Nov. 19: We have heretofore noticed the arrival of a party of men from the General Crook mine with a lot of gold bullion, and now give additional particulars of their success. Ed. I. Johnson, with two partners, reduced in two arastras, twelve and a half tons of quartz, which yielded a little over 105 ounces of gold, and was sold at $17 per ounce. This is the discovery company and they are down with their shaft 30 feet, vein about three feet wide, and splendid specimens of ore, some of which may be seen at Buffum's store and at the Cabinet saloon. John White and three partners, working two arastras on an extension of the Crook, reduced 12 tons of ore, yielding fifty and one-fourth ounces. Wm. Cullomher, running one arastra on another extension, brought in about $200 from three and one-half tons. The Crook miners hope to be able to make another run before winter finally closes in on them, though they may be forced to quit grinding rock at any time. The elevation of the mine is about 7,500 feet, or 1,000 feet higher than Prescott, and ice forms in the arastras every night now, and the storm last week brought them some snow, and so soon as heavy snows come they will be compelled to send their motive power—mules and horses—to the valleys for feed. Probably 15 men will winter on the mine, and continue to take out ore till spring. W. F. Banning has been sending ore from his mine, the "U. P." a couple of miles west of the Crook, to Noyes' 10 stamp quartz mill by Simmons' pack train for two weeks past, at a cost of $10 per ton, and the mill started for the first time, yesterday morning, and our informant says is working beautifully. S. O. Frederick & Co., have 300 tons of ore piled up at their mill, and have been busy at work for two weeks, remodeling the mill building preparatory to putting in steam power to run ten stamps. The machinery is now on the road.

Colorado.

MINING ITEMS.—Central City *Register*, Nov. 18: The result of last week's run of the Briggs Bros. 25 stamp mill principally on Briggs' lode ore, is a handsome gold retort worth about $1,500 in currency. The First National G. M. Co.'s claims on the Burrough's lode, Hockings & Co., lessees, are turning out ore that runs 7¼ ounces per cord, or about $18 50 per ton, in the stamp mills. The bullion shipments of the two banks of this city during the past week, foot up at $22,626, coin value, in gold and silver. Added to Prof. Hill's shipment of silver, during the same time, the total coin value of gold and silver bars shipped from the county during the week, has been $38,420. This is, comparatively, an exceedingly light shipment, but is accounted for satisfactorily to all who understand the necessity that exists for doing a certain amount of dead or non-productive work in mining, from time to time, such as sinking shafts, erecting shaft houses, enlarging or changing hoisting gears, and making many other like necessary preparations for this kind of work is now going on in portions of the Kansas, Gunnell, and several other large mines, and their necessarily diminished bullion product during the progress of such work, is immediately and perceptibly felt in the aggregative bullion shipments of the county. In a very short time, however, these developments and improvements will have been completed and mining in all parts of the county, will have settled down to the regular and satisfactory business of the winter season, that of ore producing. During the last six weeks of the past season, the 135 feet of Wm. Queen's placer claims in Russell gulch, near the mouth of Elkhorn gulch, produced a little over 330 ounces of dust and nuggets, which were sold for over $6,000 in currency. Chinese labor exclusively, has been employed in these diggings, and a profit of about $2,000 is reported from about two months of sluicing. The shortness of the working season was due solely to lack of water. This want is one which we trust will never again be experienced after the return of spring, for with that, it is hoped, will come an unfailing supply of water through a country ditch.

Idaho.

ROCKY BAR MINES.—Idaho *Statesman*, Nov. 17th: Col. Mat. Graham of Rocky Bar, Alturas county, left here on Saturday morning for San Francisco, California; his object in visiting San Francisco is to effect the sale of certain mines which lie a little above the town of Rocky Bar, and known as the Idaho, Vishnu and Emmet. These mines are sufficiently developed to determine upon a value, and the only reason for offering them for sale, is the want of capital by the present owners to put up necessary machinery for operations. The Idaho mine is opened by two tunnels. The upper tunnel runs 350 feet on the course of the vein and is nearly all worked out to the surface. The lower tunnel is 400 feet long, and 150 feet on the course of the vein, when it shows all the way a splendid lead. The mine has yielded a large amount of money, paying from $20 to $75 to the ton, in free gold. The Vishnu mine is opened by a tunnel 330 feet in length, running 80 feet on the course of the vein, and 140 feet below the surface at the extreme end, showing a vein three feet wide of good paying ore. The ore yields from $50 to $150 per ton. The mine is well opened and timbered, and enough ore can be taken out of this mine to keep a 10-stamp mill running constantly. The Emmet or Wayanda has been opened by a tunnel 100 feet in length, which taps the vein, 70 feet below the surface, and runs 100 feet on the course of the vein. The level shows a vein two feet in width, and the ore yields from forty to fifty dollars to the ton, gold. These three mines all lie in the same mountain, one above the other, and could be worked from one tunnel with a track laid so as to dump the ore into a mill only a short distance below, with plenty of wood near by, and an abundance of water. In fact, the location and facilities for working are as good as in any quartz camp on this coast.

Seasonable Hints.

The early rains hsve heen a misfortune in some dietricts by destroying the dry feed of the pastures; but on geueral principles it is a great adventage to have the time for plowing so much extended that the fermer can, if he chooses, teke a few weeks for the preperstion of whet is properly the work of the season. Plowing mey be done eo much in advauce this ysar the ground will have time to eweeten, a very desirable preliminary to the plenting of orchards and ornemental trees. Every farmer who is creating a home ehould intend to plent all the pnblic roads which touch his property with shsde trees, and if he cannot do it sll at once, let him begin with a few near his building site, and add to his plsntations year hy year. The embowering shades around Locust farm house, at Walnut Creek, show what pleasantness a little care and forethought at the right time will secure. Make a hegiuning, the trees will grow while the family ere asleep, and year by year the noble forms of the arborial kingdom will be sdding grace, and giving unconscious instruction to all your lives. Have a few boxes of earth near your house by the well or spring, into which the chance seeds you gather from various eourcee may be planted, and you will be surprised to see how fast a collection will be made, and a hald, uninviting ranch, grow into a "country seat."

Heving decided to plant a border or roadway with shade trees, tho sooner the ground is worked the better. Don't put off this work till the crops are in—or uutil you get the trees. If you do they will not he half planted. They never are when the joh is done up at once. Nature will not put her seal of approval upon any work which doee not follow her methods. Therefore run two or three furrows along the line intended to be planted, and follow eech with a second furrow, or hetter still with a subsoil plow. Then mark off the position for the trees, say sixteen feet apart, digging a hole at each point, at least three feet in depth, and in digging throw the bottom soil further and further away from the hole, thst none of it may be fed to the roots of your trees. If the subsoil is clayey, or otherwise impervious to moisture, it ie an excellent plan to bore down from the bottom of your hole with a post augur as far ae it will reach. I have seen snch holes nearly full of water, why some many trees perish efter three or four years' vigorous growth, from water rolling off the roots. Good underdrainage is essential to the growth of forest trees.

The digging of the holes being finished, it is well to look over the nursery catalogues and think what is going to be the most profitable or ornamental. Our trees will be allowed to grow in their own form and likeness, open on all sides to the air and sunshine, if we plant them sixteen feet apart, in ten years we must cut out hslf, in twenty we must cut again, in csse we select from the Anstralian giants, as we probably shall. In twenty years the gum trees will make a noble avenue, and as no amount of toppiug will long restrain their disposition to rise above earthly thirgs, in forty yeare, if untouched with the kuife, they will show grand silvery trunks, with shimmering meesee of foliage too high for shade trees, hut giving picturesque beauty to the landscape. This applies more to the eucalyptus globulus or blue gum, the cheepest and commonest species. But in planting an avenne, or even ons side of a publio road, the effect would he more agreeeble if several kinds of trses were used, some decidous, as maples, sycamores or elms. And if every third or fourth tree was round headsd or spreading, thus filling the line with foliage at the ordinary hight of our native trees. Different species of eucalyptus may be used, but they are all evergreeu, end do not make the charm of variety complete. Eucalyptus engenoidss, the mountain blue gum, is a fine tree to plent along a road, or near gates, it can be arched and worked into ornamental forms. Along my iuterior drives or farm roads I should plant walnut and fig trees; the walnut ia one of the finest avenue trees in the southern part of the State. In a group of treee, the clean, white limbs of the fig or buckeye are charming, when relieved againsta backgronnd of dark evergreeus, such as laurels or oaks. Our California laurel deserves to be plented wherever the soil is moist enough; there is no foreiguer which can compete with it in the beauty and value of ite timber. Of the euoalyptus or gum trees, I should plant two different kinds, and ten to one of the blue gum, because it is soonest available for posts or other uses, end I should prefer to cut it in thinning out. Eucalyptus peperita, or peppermint gum, odorata, acmenoides or white mahogany, pendula, or weeping gum, amygdalina, or cinnamon bark, which is said to reach 450 feet in ite native wilds. Lsucelota and virninalee ought to be in every good collection. The readers of the RURAL PRESS will remember Dr. Gibbone illustration of the right and wrong way to plant gum trees, and what he said about trimming then, eomething like a year ago. The article ought to be pasted up were it can be read and re-read through the planting season. All the species of eucalpytus which I have named grow from 175 to 400 feet in hight; It only reqnires a moment's thought to see that they are not appropriete for door-yard trees or house sheltere. One of the prettieet trees to grow at a distance of a few rode from one's house ie acecia melanoxylon. A celamifolia is a rapid grower. Implexa is a fine tree with leaves like a Turkieh scimetar in shspe. Lineeris is a graceful, willow-like species.

Perhaps "Seasonable Hints" might include a word ahont the planting of city lots. Nearly ell lots are over plsnted, and there is too little individuslity exhibited in the selections.

It hss alwaye seemed to me that a misteke is made in growing grass in close proximity to our dwellings. The moieture required to keep it thriving is not wholesome after sunset. A few choice shrubs, carefully tended, and washed free from dust, a rustic basket, or two filled with gay climbers or trailing plants, with fine, dry gravel close to the building, is a good sanitary, if not æsthetic sense. When roses are grown against the house, they should be thrown out at least a foot by wire supports. A single city lot can always exhibit some fine plants in flower by making judicious selections, yet never look huddled or confused. J. C. C.

The Hop Crop of '74.

During the hop-picking seasou an article appeared in our paper which considerably overestimated the prospeotive hop crop. At the present time the crop hae mostly paesed out of the hands of the producers, and is now in those of consumers and dealers, or has been shipped to distaat markets; consequently a more accurate estimste may be formed of the extent of the yield. We find by inqniring of various reliable parties thst 5,000 bales is as close an approximation to a correct estimate as we can obtain. From our intercourse with hop-growers we were led to expect a much larger yield; and were prepared for an estimate a third larger; but we accept the report of 5,000 bales as reliable. This, we find, is a gain of abont 1,000 bales over the crop of '73. Of these 5,000 bales, about 1,500 only sre wantod for home ooneumption.

Dealers speak favorably of the late crop, both of the product iteelf and the manner in which the producers have placed it upon the market. They declare that it will do much towards estabiieh ing the reputation of California hops in the markets of the world. Observation and experience have proven that the peculiarities of the soil, as well as of the climate of California, are particularly favorable to hop culture; furnishing in remarkable abundance the materials which produce a rich, oily, fine flavored hop. An examination of samples exhibited at some of the commission houses in this city, and also at the growers' warehouses, is sufficient to satisfy any one of the correctness of this view; and also that the growers understsnd their business. We have never seen hops more thoroughly prepared for market. In moet cases the producers have nsed a heavier material for beling than is used at the East, and in this they have done well. Hops baled in this way will retain their flavor and color much longer than in light, thin material; thus retarding the depreciation in the value of hops which age produces. Such points tell in the commercial reputation of hops produced in any district.

So much for the hop crop of '74; it ie order now to begin to thiak and talk about what the year '75 is likely to bring forth. Probably none of the agricultural products of California have given a better return to the producer for the preeent year than hops. It has not been a "big thing," but has given good, remunerative prices; and even this view presents such a contrast to the returns from other crops thst, in the natural course of trade, we may look for something like a rueh from some other departments of farming to hop culture. We have taken occasion in former articles on hop mattere to point out the vicissitudes of thie business; and although we do not helieve that the hop crop in California is as liable to damage from vermin and mildew as in other hop growing localities, the danger from ovsr production is probably greater here thau in auy other quarter; all enterprises—agricultural as well as others—being of a more ehifting character than eleewhere. No eerious danger is to be apprehended from this quarter dnring the coming year, as eny increase of hop area that the profits of the late crop may induce, will not tell on the market until '76. It would he eafe to expect an increase in next year's crop of a thousand bales over that of the present year; but there is nothing ominous in this prospect; and we hope to be able to present in next season's hop report as satisfactory a showing as we have given of this; but if the inconsiderate advice which has been sown broadcast through the country ie followed ae rashly as it is giveu, we shall expect to ses the hop growere of California in a far worse predicament in the fall of 1876 than are the wheat growers at the present time. It is easier to go into anything than it is to get out of it; hence the propriety of looking before leaping.

POTTERS CLAY of fine quality is found both over and under the Lincoln coal deposit. An English gentleman who seemed to be conversant with such matters, informed Mr. Coflin, the new Superintendent of the mine, a few days siuce that these clay deposits will be likely to prove very valuable sometime; probably as much so ae the coal itself. We also learn from Mr. Patterson of this place, who has critically examined both the coal and clay, that this clay would make splendid bricks and he thinks it may provo that they will turn out good fire brick if properly manipnlated.—*Foothill Tidings.*

The Lincoln Coal Mines.

The good quality of the Lincoln Cosl heving been fairly estabiished by repeeted and thorough triels, it bscomes of the utmost importenoe to our county that the extent and value of the mines should be known. The coal hss been thoroughly tested at the Sscramento waterworks, and is pronounced superior to wood for making steam. It is considered cheeper at the seme price, and there can be no queetion that when proper arrangements ere concluded for sending it to merket, the fuel supplied by these mines will tske the plece almost entirely of wood. The mines are situeted within a few rods of the railroed station at Lincoln, a sidetrack affording ell necesesry facilities for shipping, the coal being dumped directly above the cars. The main shaft is sixty-eight feet deep, from which drifte have been run east, west, north and south, the longest extending two hundred end sixty feet from the shaft. Numerous side-drifte have also been run, and the extent of the hed developed. In the main tunnels, sawed lumber eight inches square is nsed for timbering. The vein is about eight feet in thicknese, varying of course in different plsces, but never less than five feet. The Superintendent informe us that the cost of getting out the coal and landing it on the cars will not exceed sixty cents a ton, and as they get $1 50, there is good room for profit. It occurs to us thst the company wonld consult their interests by selling at lower rates. The bituminous coals of Illinois and Iowa sre furniehed at $2 per ton. If this coal is to be extensively introduced, and made to play an important part in encouraging manufactures, it must be supplied ss cheaply ss possible. Only four men are engaged in the drifts at present, but it is the intention of the company to employ a large force aa soon as the mine ie sufficiently opened to work them to advantege. The hoisting ie done by a stesm engine of ten-horse power. The land on which the mine is sitnated belongs to Col. Wilson, but it is worked by a company formed for that purpose, of whioh D. N. Coflin is Superintendent. A fine vein of potters' clay from eight to twenty feet in thickneee overlays the coal, and it is not too much to say is likely to prove more valuable than the coal itself. The olay has heen tested thoroughly, and is said to be the best in the State. Conoiderable qusntities have been shipped to Sacramento, and it now brings the same price at the mines that the coal eelle for. There ie eome talk of establishing a pottery at Lincoln, and if thie is done it will add greatly to the wealth of the county.—*Placer Argus.*

Average Value of Farm Products for 1872.

The following table, taksn from the Report of the Depertment of Agriculture for 1872, showe the sverage value per acre of the agricultural products in tbe different States of the Union, the Territories being generalized under one estimate. Possibly thie, with other tahles in the report, may withstand the closest scrutiny; but for our part we confoss that this perusel doee not etrengthen our faith in the infalibility of the statisticisn. We can account for the position which Nevada holds—the very highest on the liat—by the supposition that tbe acreage under cultivation wae extremely small, that it was put under cultivation to eupply an nrgent locel want in isolated sitaations, to furnish prospsrous mining camps with vegetables, etc., but we can hardly find suppositions even to explain how it ie that Oregon stende not only above California in the value per acre of agricultural prodnots, but above Michigan, Ohio, Wisconsin, Illinois end Indiana. Following is the table referred to:

States.	Av. val. per acre.	States.	Av. val. per acre.
Maine	$14 15	Texae	$12 84
New Hampshire	19 50	Arkaneas	18 60
Vermont	17 87	Tennessee	12 70
Massachuecetta	31 10	West Virginia	15 04
Rhode Island	34 00	Kentucky	15 54
Connecticut	33 94	Ohio	14 57
New York	22 94	Michigan	15 55
New Jersey	27 96	Indiana	13 61
Pennsylvania	20 80	Illinois	11 13
Delaware	13 24	Wisconsin	14 28
Maryland	15 22	Minnesota	11 83
Virginia	14 15	Iowa	8 49
North Carolina	11 38	Missouri	11 99
South Carolina	10 45	Kaneas	8 92
Georgia	11 68	Nebraska	7 75
Florida	11 47	California	15 12
Alabama	13 77	Oregon	15 70
Miasisaippi	15 51	Nevada	44 30
Louisiana	15 57	The Territories	25 17

MORNING STAR.—This is the name of the rich gravel mine over at Iowa Hill that we meutioned last week as being partly owned by those lucky miners, the Meesrs. Coleman of thie place. It comes pretty near being a Gress Valley miue, as nearly two-thirds of the shares are owned here. Wm. Hoskins, who ia also snperintendent, John Polglase, Capt. Frank Richards, Mrs. Rodda and others of this place are fortunate owners of shares in the Star. To show how rich the gravel averegee we may mention that dirt taken out by two men engaged in drifting for one month, was recently washed and gave a product of six hundred dollars in gold. The regular work of sluicing, with 1,000 inches of water under a 500-foot head, will hegiu December 1st, after which time look out for cheering newe of nice clean-ups from there every little while.—*Foothill Tidings.*

UTILIZING COAL CINDERS.—A processe has been invented in Southington, Conn., by which it is claimed irou can be eeparated from coal, cindere and general rubbish which accumulatee about iron manufactories.

Report on California Mining.

In a short report to the Home Office, Mr. Consul Booker incidentelly refers to the snbject of mining in Californie. He mentione that the yield of the minee of California estimated at something like 3,000,000£., shows a falling off during the psst year as compsred with the previous year—a diminution which is attributed to the short supply of weter in many parts of the mining regions during the eummer and autumn. No reliable statistice exist ae to the yield of the different description of minee, but it ie seid thet each year hydrenlic mining in Californie increesses in importence; and with the completion of eome long tunnels for drainage purposes, which were recommended several years ago, it is anticipsted that there will be a great additiou to the yield. The attsntion of the capitelist, we note, continues to be devoted to quartz mining, there being no difficulty in finding persons willing to invest in the event of the prospects being at all encouraging. Lately there have not bsen many "diecoveriee" although quartz hes been found in eections of the State which were not before believed to contain minerals.

In Nevada it is mentioned that the Comstock lead hss maintsined its supremacy by the immense yield of the Belcher and Crown Point mines, forming part of it; the former is stated to have disbursed to its stockholdsrs during 1873 £1,352,000, and the lstter £1,020,000. On the other hand the Ely district, which at one time attracted attention in consequence of the largo yield of its two principal mines—the Raymond & Ely and Meadow Vslley—appears to have lost latterly its character, inasmuoh as the two mines mentioned have ceased to pay dividends, while no others have been brought into prominence. From a atatement giving the production of precious metals west of the Missouri river, we find that the value of this production in 1873 ie set down as considerably over £14,000,000 eterling. The production of quicksilver has not shown any particuler increase; indeed, the production of the New Almaden mine has gradnslly fallen off, while others show a diminished yield. A grest many new mines have, however, heen discovered in various parts of the State, and slthough a good deal of work has bsen accomplisbed on some of them, the total yield has been so far insignificant.

It is pointed out that the production of the State for some years had been under one control, but the demand became so active that it was found impracticable to renew the contract with the owners of leading mines; at the same time an increased demand upon a diminished supply has had the effect of rapidly sending up prices. Several shipments of chromate of iron ore have been made from California to New York and England, the greater part of the ore having heen received from a mine in Humboldt county, which hss been worked for some yeare. With regard to copper, it appesrs that very little was done in California laat year, although some mines are worked in the State of Nevada, and there were eeveral shipments to Englsnd.—*London Mining Journal,*

CURIOUS PROPERTIES OF WHITE SUGAR.—In many cases white sugar has been employed as efficaciously in remedying drunkenness as emmonia. No rationale of a very satisfactory character hss yet been adduced for the action of so simple a substenoe as sugsr under these circnmstances, except that it serves to bring on a different fermentation than the existing one in the stomach, and to neutralize, by the formation of new compounds, the action of the liquors. A curious fact hae long been observed, namely, that the life of animale which breathe in water is incompatible with the presence therein of oven an inconeidsrable quautity of sugar. In some parts of Europe one of the methods pursuod in the preservation of fish consists in removing the viscera and eprinkling sugar over the interior, keeping the fish in a horizontel position so that the sugar may penetrate as much as possible. It is said that fish prepared in this way can be kept completely fresh for a loug time, the savor being as perfect as if recently caught from the water; and eelmon, especially, treated in thie manner before being selted and smoked—a tablespoonful of suger to a five-pound fish—posecesses a much more agreeable taste.

KEEPING WATER IN ZINC RESERVOIRS.—In view of the fact that water reeervoirs are freqnsntly made of zinc or have zinc liniage, Zinck, a German chemist, has made some experiments upon the influence of water on this metal, and discovered that water kept in zinc vessels dissolves zinc in proportion to the time it remains in contact with the metallic surface, and to the amount of chlorides (common ealt, etc.) contained in the water. He shows also that hoiling not only does not precipitate the zinc from such a solution, but that it even augments the solvent power of the letter. Water containing zinc, and boiled in a zinc vessel to precipitate it, would actnally absorb more zinc, and precipitate none. Thie chemist found the amount of the metal in one instance, the water having been kept for a considerable time in a zinc reeervoir, to be as high as 1.0104 grammea to the litre, or nearly fifteen graine to the quart. A smaller quantity would be very injurious, if the water were used for drinking or cooking. It is therefore recommended to coat such reservoirs with good oil-paint, containing, not litharge, white-lead, or zinc-white, but iron-ochre or asphaltum.

Useful Information.

Fire-proof Starch.

In order to make ladiss' apparel fire-proof, a starch is nsed to which sulphate, phosphate, or borate of ammonia, or what is better, tongstate of soda is added. It appears, however, according to Prof. Gintl, (a competent authority in such matters,) in his report on practical chemical preparations at the Vienna exhibition, that manufactnrers who apply thom do not always act with the correct understanding, and do not consider that the compound used must be perfectly neutral and not impure; that it is not sufficient to use tho ordinary commercial article, for instance tungatate of soda, which often contains considerable quantities of carbonate of soda, or ordinary sulphate of ammonia, and this is especially very impure, so much so that the impurities cannot stand the application of the hot iron during the process of ironing without ruining the color as well as the texture of the material.

Tho result of such mistakes is that the fireproof starch has not become of aniversal application, and as long as the makers of this preparation do not use the most scrupulous care in its manufactare, its universal introduction is oat of the question.

Prof. Gintl also calls attention to the fact that, according to his experimonts, ammonia alum (sulphate of alumina and ammonia) and hyposulphate of soda are also additions to starch, which makes it very effectivsly fire-proof. This is important, as both are cheap substances, easy to obtain, and without aay action on most colors. The latter substance prevents, if not so perfectly as some other compounds, a full inflammation, which it is a fact worthy of remark that the quality of the starch which causes it to give stiffuees and gloss to the material to which it is applied, is not in the least affected. —*Manufacturer and Builder.*

Dead Surface Varnish.—Varnishes that leave a dead sarface on drying, capable of sabstitntion for gronad glass, as for glass stereographs, and of nse in retonohing negatives, may be made by mixing solntions of resins with liquids in which they are insoluble. A solution of sandarach resin in ether, when mixed with one-fourth as much benzole, affords an excellent imitation of ground glass; one of dammar resin in benzole, when mixed with ether, also gives a good dead surface; water instead of ether, renders it at the same time, semi-opaque. A mixture of benzole with common negative varnish frequently, but not always, gives a beautiful dead surface. In all cases a great deal depends on the purity of the ingredients. It is recommended to dissolve from three to five parts of sandarech in 48 parts of ether, and to add 24 parts of henzole; or aa much as may be necessary to produce the desired resnlt. The following, by Hughes, is said to give a perfectly colorless varnish of this kind: Ether, 560 grains; henzole, 240; sandarach, 40; Canada balsam, 10; the resins are first to be dissolved in the ether, and the beozole added to the solntion.—*Boston Journal of Chemistry.*

The use of the Tongue.—To taste aud talk, of conrse. It does neither. An ulcerated tongue was lately ent entirely out at the Royal Free Hoepital in London. Within a week the man was heard distinctly to say, "I would like to have some beef tea." Blindfold a man, and tell him to open his month wide and keep it open; pat salt on his tougue, or a drop of wormwood oil—he cannot tell the difference. Take half a teacnp fnll of ice water, pour it into the oenter of a dose of castor oil; open the month, put the rim of the cup far back on the tongue, toss np the cup, down goes the oil without a taste of it as long as yoa keep the mouth open, or do not allow the oil to touch the lips. Is taste, then, in the lips? To prodace the sensation of taste, the tongue, the lips and the sabstance mnst all come in contact at the same time, as in the process of smacking the lips.

A Strong White Paste.—Dissolve 2½ oz. of gum arahic in 2 qnarts of water, and stir it into 1 pound of wheat flour nntil the whole becomes of a pasty consistency. It is then to be heated, aud 1½ oz. each of sugar of lead and alum dissolved in a little water, added thereto, and the composition well stirred until it shows eigns of boiling, when it mnst he removed from the fire. Add while hot six drops of carbolic acid. This is a very tenacious and durable paste, and may be nsed on almost any substance.

To Dye Leather Blue-Black.—Take of beeswax 3 ozs., black resin 2 ozs. Mix together, and then add: Prussian blne 1 oz, lampblack ½ oz. While the mixtare is cooling, add turpentine till a suitable consistency is obtained. It should be applied with a soft rag, and the leather afterwards poliehed with a brush.

New Lubricant—An English patent describes a process in which resin oil is nlaced in a steaming apparatus and is then mixed with lime water. The semi-seponified oil which results if allowed to settle until the water rises to the top and the water is then removed and the oil distilled.

Roof Drainage.—In providing for the removal of rainwater from roofs, it is usual to consider the depth over the whole area of the roof at half an inch per hour.

A curious piece of mecheuism has been produced hy an Amsterdam jeweller, called the "Great Mecbanical City," and is twenty feet long by fifteen wide. There are housse, castles, churches, and stores in it, just as they appsar in almost any European city. People walk and ride about. Horses and wegons and railway cars paes throngh the streets. Boats pass up und down the river, while some are loading and others unloading at the docks. Mille are in motion. A foantain plays in the public park, and a band of music fills the air with melody. There are also forts with soldiers parading about them, blacksmith shops with artisans at work in them, and pleasure gardons with people dancing in them.

The Strasburg Cathedral is no longer "the highest spire in Europe." The new church of St. Nicholas, Hamhnrg, has just been finished, and the great cross was placed on the summit. The total hight is 472 feet. This is called six feet higher than Strashurg.

Simple Safety Fuse.—Soak a plaited cord in a solution of saltpeter.

Good Health.

The American Health Association.

This association recently held its annual session in Philadelphia. The meetings were largely attended, and attracted much interest. A committee was appointed to report on persons engaged in various ways for agricultural and other purposes. The next annual meeting will be held at Baltimore. A special committee was appointed to deviso a project of law to meet the public want in establishing Boards of Health.

The essays were of a practical nature and contained a great number of valusble snggestions. It is a remarkable fact that in consequence of the care and attention bestowed hy men of the class similar to this body upon the health of the great city of London, it has become one of the healthiest communities in the world, and its eanitary condition is very decidedly snperior to that of most of the English rural districts. This fact shows that the deliberations of the Boards of Health concern rural districts quite as mnch as populous cities, and the latter one not necessarily unhealthy.

Drs. Sterns, of Maryland; Snow, of Rhode Island; and Curtis, of the District of Colnmhia, read papers on saaitary relations of pharmacy, and materia medica was read by J. M. Marsh.

Dr. Hartshorne presented resolntions favoring the establishments of large abattoirs in preference to private slaughter-houses; hnt, as it is impossihle to enaure against all contamiuatione of water and air, snch establishments should be remote from the centers of population, and, if possible, on tide water.

A series of questions, accompanying the resolutions, were answered by Dr. Rsnch, of Chicago, who concluded by saying, "I do not hesitate to say that abattoirs can be so conducted as not to be injnrious to the public health." The resolutions were adopted.

Dr. Goodwin offered resolntions favoring the establishment of State Boards of Health. The closing address was delivered by Dr. Morgan Meyers, of New York.

To go to Sleep.—With many people who are past the meridian of life, it often becomes difficult to obtain a good night's sleep; indeed, the habit of waking at a certain hour of the night and lying awake for several hours, becomes fixed, and one which is very difficult to throw off. There may he various causes which will produce this effect, but there is one very prominent canse, and that is indigestion; and indigestion is often caused by the habit of drinking too mach tea or other fluids at supper; the conseequence is that steady and sound sleep throngh the night becomes impossible without the use of some means which will overcome this propensity to lay awake.

To do this and go to sleep in five minutes, is not a very difficult thing, and may he done hy applying friction to all parts of the body and limbs. To accomplish it take a crash towel, and give it a lively motion in rubbing downward from the head until the blood will be put in lively circulation, rubhing hardest upon the chest. If a towel is not at hand, the hand may he used for the purpoee.

How to Avoid Colds.—An editorial in the *British Mining Journal*, on catohing cold, concludes thus: "The practical considerations which are the outcomes of this review of the pathology of colds are these: Never to wear wet clothes after active muscular exertion has ceased, but to change them at once; to meet the loss of the body heat by warm fluids and dry clothes; to avoid long sustained loss of heat which is not met by increased production of heat; to increase the tonicity of the vessels of the skin by cold baths, etc., so educating them to contract readily on exposure, by a partial adoption, indeed, of the 'hardening' plan; to avoid too warm and debilitating rooms and temperatures; to take especial care against too great loss of heat when the skin is glowing; and to prevent the inspiration of cold air by the mouth by some protecting agent, as a respirator. We can readily understand how a respirator should be an effective protection against winter bronchitis in those so disposed."

Effect of Hot and Cold Fluids on the Teeth.

The effect of hot and cold fluids upon the teeth has herstofore been supposed to be injurions. The dental profession have encouraged this belief, the reason for the supposed effect being, not that the extremes of heat and cold injure the vitality of the teeth, but that they crack the enamel, and then expose the dentine to external influence which tend to produce decay.

Dr. Robertson, of Georgetown, Mass., communicates to the October number of the *Dental Cosmos* an account of experiments performed by him, which demonstrates that the supposed injury resulting from the use of hot and cold drinks has no foundation in fact. He first proves that during the act of swallowing fluids very little contect of the substance with the teeth takes place. The account of his experiments to prove that the cracking of the enamel is not dne to sudden changes of temperature we give in his own language: "The experiments made, and which proved that no amount of change of temperature can by any possibility be attained in the mouth, were: 1. I took a vessel filled with weter, which I heated until it boiled, and which I kept boiling until I had concluded my experimente. I then took a tooth which, on examination, proved to have a perfect enamel. This tooth I held in my closed hand until it had acquired the temperature of my hand, or nearly that of the mouth. I then unclasped my hand directly over and as near as I conveniently could to the hoiling water, and dropped the tooth in. I let it remain for a few minutes, and then took it out. First, I examined it with my naked eye; then through a double-lensed magnifying glass of about one and a half inch focus. There were no cracks visible in the enamel. Next, after bringing it to about blood-heat, I threw it into iced water. No cracks. Then I returned it to the hoiling water, and from thence immediately into water of the temperature of ordinary well-water; that is to say, of abont 60 degrees or 65 degrees. Still no cracks. Finally, I returned the tooth to the hoiling water, and from that plunged it into iced water. This cracked it badly. Thus I proved that it requires a sudden change of temperature of about 160 degrees to crack the enamel of a tooth which had been extracted and was deprived of all its vitality and other sustaining supports and adjuncts."

Dust as a Cause of Catarrh.

Dust as a cause of catarrhal affection is beginning to be recognized hy the members of the medical faculty. Some years ago the present editor of the *Artisan* contribnted to some journal, the name of which he cannot now recall, the result of his experience with acute attacks of the naso-phsryngeal membrane, affirming his opinion that city dust has caused this inflammation in many instances. His attention was attracted to this subject from the great relief he experienced through short voyages at sea, and the recurrence of the attacks upon his return to the city at a time when the streets were exceptionally dusty. Dr. W. H. Bennett, of New York, has contributed to the September number of the *Medical Record* a very able essay upon ahnormal conditions of the superior air passages and some of the causes of chronic inflammation of these parts, in which he ranks dust as one of the most efficient causes. He thinks that ho has proved satisfactorily that chronic catarrh may be produced by the action of dust, through experiments upon animals forced to breathe air which contained no more dust than is frequently seen in air in certain parts of the business portion of New York. Dust issuing from the registers of houses heated by hot-air furnaces, and dust of streets—which is a combination of nearly all substances, filthy and otherwise, known to mankiud—he regards as more effective in producing these complaints than clean earth-dust and dust occurring in various manufactories. It seems certain that chronic catarrh is more prevalent in cities than in country districts. Dr. Bennett estimates that at least four or five out of every twelve in the city of New York, irrespective of their calling or profession, suffer from chronic inflammation of some part of the respiratory membrane situated above the trachea. Naso-pharyngeal catarrh, he states, is extremely prevalent among the conductors of city horse-cars, and this disease is always aggravated when the streets are dry and the consequent amount of dust dragged after the cars is excessive.

Influence of Magnets on the Human Constitution.—A physician in France recently announcing the most decided and astonishing results by submitting nervous patients to the action of a magnet, the subject has been thoroughly tested by M. Volpuelli, who, after the most scrutinous search and patient observation, has come to the decided conclusion that neither natural nor steel magnets, nor electro-magnets, have the least influence on the nervous system; that the effects supposed to he produced by the magnet are solely due to the imagination of the patient when he knows that the magnet is there. He found that whatever kind of patients they may be—nervous persons, clairvoyants, mediums, etc., they could be approached with any number of powerful magnets without any effect whatever being produced, provided they did not see or suspect the presence of the magnets.

Domestic Economy.

How to Cook a Beefsteak.—Some time since a complete encyclopædia of useful knowledge in human form became an inmate of the family. When this learned guest came among them he was constituted as an oracle in many cases, and was asked one morning "Would he tell or show them a better way to cook the steak for breakfast?" He took the thin, long-handled frying pan from the nail, and putting it on the stove heated it quite hot. In this he put the piece of steak previously pounded, bat to their surprise did not put a particle of botter in the frying-pan and did not salt his steak. He allowed the steak to merely glaze over and then turned it quickly to the other side, turning it several times in this manner until the steak was done. Four minutes were not employed on the operation, but a jaicier steak was never eaten. It was, when done laid on the platter, previously warmed, and was buttered and salted and set a moment in a hot oven. Allowing the steak to heat but a moment on each side helped it to retain all its sweet juices, and putting the salt on at the last moment after it was on the platter drew out its juices.

To Make Superior Mince-Meat.—A Boston lady sends for publication in the *Germantown Telegraph* the following receipt for making mince-meat, which is now in season. She informs us that she has tried various modes but finds the following to be the best: Take seven pounds of currants, well-picked over and cleaned; of finely-chopped beef-suet, the lean of a sirloin of beef minced raw, and finely chopped apples, (the Golden pippin or Smith's cider preferred,) each three and a-half pounds; citron, lemon-peel and orange-peel cut small, each half a pound; fine moist sugar, two pounds mixed spice, an ounce; mix well and put in a deep pan. Mix a bottle of brandy and white wine, the juice of the lemons and oranges that have been grated together in a basin; pour half over and press down tight with the hand, then add the other half and cover closely. This will keep a whole year or longer, and is frequently made one season to keep over for the next.

Color in the Kitchen.—Alum in Bread.—In a recent work, F. R. Eaton, condemns the "finest white bread" so much in request in modern times, as not merely deficient in gluten and in the natural salts of wheat, but as tempting the baker to use alum. It is remarkable that not a few of the most dangerous adulterations spring from introducing the idea of color into our kitchens and our dining rooms. Alum, the author considers, tends especially to produce constipation. The alum in bread, however, is always accompanied by an excess of the phosphate of potash, present in the wheat. Hence we may infer that double decomposition will ensue during digestion, the alumina combining with the phosphoric acid to form the insoluble phosphate of alumina. This, then, is our opinion, the great objection to the use of alumised bread, that a considerable portion of the phosphoric acid in our food is thus rendered unavailable.

A New Article of Diet.—A writer in the Philadelphia *Medical Times* states that he has, by way of experiment, eaten small quantities of the transparent jelly of the ordinary jelly-fish as raw oysters are eaten, and found it not unpalatable; and the London *Lancet* says that at a luncheon given by one of the directors of the Brighton Aquarium, the *piece de resistance* was boiled octopus, or "devil-fish," which was pronounced to be very palatable, resembling boiled lobster and skate.

Should such diet become popular, its abundance on the Pacific coast would place it within reach of all. Which of our hotels or restaurants will he the first to add to their bill of fare "boiled devil-fish?"

A Nice Cream Pie.—One cup white sugar, two-thirds of a cup of cream, two eggs, two cups flour, one teaspoonful cream-of-tartar, half teaspoonful soda. This will make seven thin cakes, between which spread the cream.

For the cream, take half a pint of milk, put into a basin of hot water on the stove, heat one egg with white sugar enough to sweeten and add two tablespoonsful corn starch; stir this into the milk when hot, and flavor with vanilla or lemon. When cool put between the cakes.

Hop Yeast for Warm Weather.—Two quarts water, twelve potatoes, a good handful of hops; press the water from the bag of hops when the potatoes are done, and mash fine; add one teacupful of white sugar, a handful of salt, tablespoonful of ginger; strain through a colander and boil a few minutes; add yeast to raise when cool; no soda is required to make this bread. This yeast will keep in hot weather until it is used.

Digestive Biscuits.—Mix the flour or wheat-meal in as small a quantity of water as will cause it, after much kneading or rolling, to adhere; then roll, cut into biscuits about half an inch thick and three inches square, and bake well in a quick oven. The unfermented bread is made in a similar way, except being formed in rolls about an inch thick, cut deeply across, and baked in a moderately hot oven.—*Vegetarian Cookery.*

Grandmother's Gingerbread.—Cup and a half of molasses, cup rich sour cream, teaspoon saleratus, tablespoonful ginger; mix a little stiff.

MINING AND SCIENTIFIC PRESS

SUBSCRIPTION AND ADVERTISING RATES.

SUBSCRIPTIONS payable in advance—For one year $4; six months, $2.25; three months, $1.25. Clubs of ten names or more $3 each per annum. $5, in advance, will pay for one and one-third year. Remittances by registered letters or P. O. orders at our risk

ADVERTISING RATES.—

	1 week.	1 month.	3 months.	1 year.
Per line.....	.25	.80	$2.00	$5.00
One-half inch.....	$1.00	3.00	7.50	24.00
One inch.....	2.00	5 00	14.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in peculiar parts of the paper, inserted at special rates.

We Will Prepay All Postage

On this paper after the 1st of January, 1875, as the law demands. This is equivalent to reducing the subscription price 20 cents per annum. Besides, it will save subscribers the annoyance of paying petty postage bills every quarter.

San Francisco:
Saturday Morning, Nov. 28, 1874.

TABLE OF CONTENTS.

EDITORIALS AND GENERAL NEWS.—Hydraulic Mining in California, 337. Birds as Weather Prophets; Look Out for Your Claims; Burnt or Missing Coal Vessels; The Wheeler Expedition; Prospecting in the Black Hills; Mineral Hill Mines, 340. The Eocene Epoch in California; Common Magpie, 341. A Good Idea; Oakland Library; Mammoth Beat; Cheap Food; A Grange Wagon Road; Drowned in a Well; Honey in Bedwood Boxes; Philosopher Pickett; Grangers in Wisconsin; Somebody Says; Robbery on the Cliff House Road; Bold Robbery; Incendiary Fires; Elections in France; Heavy Fog, 348.

ILLUSTRATIONS.—Hydraulic Mining in California, 337. Common Magpie, 345.

MECHANICAL PROGRESS.—Better Tools and Implements Wanted; Fire-proof Colors; Success of Steam Canal Boats; Fixing Slates; Tool for Riveting Boiler Tubes; Nine Reasons for Iron Structures; Iron as a Wood Preserver; Screw vs. Paddle; Lining Metal Tubes; A Fire-Extinguisher for Ship-Board, 339.

SCIENTIFIC PROGRESS.—Professor Henry and Tyndall in Collision; Temperature of the Sun; Important Fossil Discoveries; The Nationality of "Old Probabilities," 339.

MINING STOCK MARKET.—Thursday's Sales at the San Francisco Stock Board; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 340.

MINING SUMMARY.—From various counties in California, Nevada, Arizona, Colorado and Idaho, 340-41.

GOOD HEALTH.—The American Health Association; To go to Sleep; Effect of Hot and Cold Fluids on the Teeth; Dust as a Cause of Catarrh; Influence of Magnets on the Human Constitution, 343.

USEFUL INFORMATION.—Fire-proof Starch; Dead Surface Varnish; The Use of the Tongue; A Strong White Paste; To Dye Leather Blue-Black; New Lubricant; Roof Drainage, 343.

DOMESTIC ECONOMY.—How to Cook a Beefsteak; To Make Superior Mince-Meat; Color in the Kitchen—Alum in Bread; A New Article of Diet; A Nice Cream Pie; Hop Yeast for Warm Weather; Digestive Biscuits; Grandmother's Gingerbread, 343.

MISCELLANEOUS.—Metallurgy, 338. Seasonable Hints; The Hop Crop of '74; The Lincoln Coal Mines; Average Value of Farm Products for 1872; Morning Star; Utilizing Coal Cinders; Report on California Mining; Curious Properties of White Sugar; Keeping Water in Zinc Reservoirs, 342. Sugar in California; Car Oscillator, 350. A Wheat Steam Fleet; Rocky Point, 351.

BIRDS AS WEATHER PROPHETS.—At the last meeting of the California Academy of Sciences Dr. Cooper stated that the bird presented by Mr. Blnnt, called "Foolish Guillemot" (*Uria lomvia*) by the whalers, was the first of the kind obtained on the California coast. It is common in the Arctic ocean and the far north Atlantic, and has doubtless been driven so far south by unusually cold weather. He also stated that Mr. Grnber has lately obtained here the first Californian specimen of the "Arctic Skua" (*Stercorarius parasiticus*), another evidence of severe weather approaching. The interior papers, about two months since, noticed also the uncommonly early arrival of the wild geese from the north. The unusual amount of rain already fallen is an evidence of cold weather northward, though we have not felt it here, as the nnder-current of cold north winds condenses tho moisture brought to ns by the warm sonth winds. These facts ehould be recorded, and we may find the "Foolish" Gnillemot really a very weather-wise bird.

UNIVERSITY LECTURES.—We give in another colnmn a lecture on metallurgy, delivered at the College of Mines, University of California, by G. F Becker, B. A. Ph. D., a graduate of the Royal Academy of Mines, at Berlin. Arrangements have been made by which a number of lecturee on snbjects connected with mining mattere will be delivered by different pereons. We ehall endeavor to obtain those of general interest for pnblication.

THE OAKLAND FOUNTAIN.—The temperance people of Oakland enjoyed a gala day on Saturday last, heing the occasion of the unveiling and inauguration of the memorial fountain. The fountain has been erected to commemorate the temperance victory won at the ballot box on the local option question.

Look Out for Your Claims.

Owners of unpetented mining claims ere hereby reminded that the time for the first annual expenditure on cleims located prior to the passage of the act of May 10th, 1872, expires on Jannary 1st, 1875. The paragreph in the law referring to this, reads as follows:

On each claim loceted after the pessage of this act, and until a patent shall heve been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements mede during each yeer. On all cleims loceted prior to the pessage of this act ten dollars' worth of labor shall be performed or improvements made for eech one hundred feet in length elong the vein until a patent shall have been issued therefor, but where such claims are held in common such expenditure mey be made on any one claim; and, upon feilure to comply with these conditions, the cleim or mine npon which such a failnre occurred shall be open to re-location in the same manner as if no location of the same had ever been made.

The bill was so amended that the time for the first annusl expenditure on claims loceted prior to the passage of the act, was extended to January 1st, 1875. Those claims which are not patented are subject to the provisions of these laws requiring the annnal expenditure, and where work has not been done it is time now to begin.

There is another exceedingly important feature of this provision of the law, in this—that elthough all proceedings for patent may have been had, the final payment made to the receiver, and the case sent to Weshington for patenting; thet until the petent itself is actually issued the necessity still exists for doing the work or meking the expenditure upon the cleim to prevent a re-location, the seme as if the application for patent had not been made, as the law requires the annnal expenditure to be made until the issnence of a petent for the claim. Parties heving claims pending et Washington should not, therefore, fall in.to the error of supposing that they are relieved from doing work to hold such claims, tho patent title itself alone relieving the claim from that necessity.

Placer mines are exempt from annual expenditures. The acting Commissioner of the General Land office decided, April 25th, this year, thet the 10th section, teken in connection with the 5th section of the act of May 10th, 1874, showed that it was the intention of Congress to require annual expenditnres ouly upon veins or lode claims, leaving placer claims as they had been previous to the pessage of said act, subject to the operations of the *local* laws, rules, regnlations and customs.

The metter of annual expenditures is one which should be attended to without delay, as there ere doubtloss e number of men who have "spotted" desirable properties upon which the requisite emount of labor has not been done. The time for the first annnal expenditure has been postponed so long that there is no excnee for failnre to work, if the mine is supposed to he worth the outley.

Burnt or Missing Coal Vessels.

No less than *nine* vessels loaded with coal for California, are reported as having been destroyed by fire within two or three months peet. The loss of life and property from spontaneous combustion of coal on shipboard seems to be rapidly on the increase of late years.

A return has lately been made to the British House of Commons from which it appears that 38 coal-laden sailing vessels and one steamer were reported as burnt or missing from 1868 to 1873 inclusive—involving a loss of 358 lives. Of the total nnmber of lost and missing it is known that at leaet 24 were burned and it is bnt reasonable to suppose that at least one-half the "missing" were also burned.

The liability of coals to spontaneous combustion, if placed in bulk when wet, is well known; but it is not so well known that many coals will also generate heat when placed in bulk *dry*—yet snch is the case, especially if they are so placed as to be subjected to great pressure, and the slight friction inseparable from a cargo of loose material at sea. The fire-damp which escapee from coal mines arises from slow decomposition (combustion) of the coal at a temperature but little above that of the atmosphere.

This decomposition or combustion is contentantly going on with all coals, at all temperatures and under all conditions. But when it ie placed (even dry) in bulk and subjected to accumulated pressure, this heat, nnless the most perfect ventilation is kept up throngh the mass, will also accnmulate until active combustion sets in. Even common charcoal, when in a fine state of subdivision, will ignite epontaneously when piled np in a dry room, in large bulk. There is really no positive safety in traneporting soft coal in bulk, by sea-going vessels.

DEPLORABLE.—Some 200 blast furnaces in various sections of the country have suspended operations, and the workmen, on the eve of a severe winter, are thrown out of employment.

THE prospecting drifts in the old Sacramento gronud of the Sierra Novada mine are ehowing some very favorable ore developments.

The Wheeler Expedition.

The present campaign of the Wheeler exploring expedition has been quite successful, and some of the results are of great interest. A number of very valneble paleontological discoveries have been made. Professor Cope and Dr. Yarrow have unearthed in the valleys of the San Jnen, a lerge nnmber of vertebrates of enormous size, some of which are entirely new to science, and those that are not are of a very rere and comparatively unknown species. Among them are several very perfect skeletons of the mastodon race, and a very large variety of memmoths, cousin-german to to that elephant of the past. The discovery has not been arranged and classified, so that a complete list of the different specimens embraced in it cannot be given, bnt this work already is in progress, a nnmber of the specimens having been forwarded to Washington soon after their discovery, where competent persons at once set to work npon them. Besides these, es meny as a hundred additions to the known list of invertebretes have been made. The natnral division of the survey under Dr. Rothrock, the well-known botanist, has also achieved substential snccesses. An immense nnmber of specimens of mammals, reptiles end fishes, and as many as 1,000 bird-skins, some of them new varieties, were obtained.

The most interesting work to the people of Colorado, says the *Denver News*, was prosecuted by Dr. Leow, chemist in ordinery to Lieutenant Wheeler, who has analyzed all the thermel and mineral springs in the regions traversed hy the snrvey. He has also enalyzed the soils of the different formations found in the sonthern part of the territory, in northern Mexico and eestern Arizona, and from this valnable resnlts are expected. The expedition has also succeeded in carrying out the work of triangulation begun in 1873, and, as a result, a csrefnlly prepared and accurate map of portions of Colorsdo, and contiguous territorics to the south, now known only to prospectors, and that indifferently, will before long be issned by the War Department. In the prosecution of this work the surveyors, by speoial orders of Lieutenant Whceler, have been on the lookout for feasible passes in the mountains for the trensportation of army supplies across the main range, and Lieutenent Marshall's discovery of a pass second only to the Coochetope end Tennessee, is a proof of how faithfully their endeavors have been cerried out.

Prospectors in the Black Hills.

Tho Black Hills excitement seems to have subsided considerably within the pest mouth. A few months since tho papers were full of accounts of tbe Black Hills end their richness. We heard of numeroue parties who intended going on prospecting expeditions this winter into the Sioux country, but probably most of them have conclnded to wait until the opening of spriug. Now, e report having been rceeived from the Cheyenne egency, Dakota, that abont 60 white miners are working on the Sioux reservation in the Black Hills, Secretary Delano reqnests the War Department to remove any persons so trespessing, in order to avoid trouble with the Indians.

We do not know how this will end. It looks as if there would be eome kind of a fight, either between the Indians and the minere, the War Department and the minere or a general row all round. If the prospectore have struck any diggings half as rich as were reported a few months since, it will be difficult to drive them away; and, if they are driven away, it is probable that they will return again with others to help them. If there is very much gold scattered round in the Black Hills the probability is that the miners will get it eooner or later, bnt naturally they are desirons of getting it as soon ae possible. Theee men have taken their lives in their own hands by going into the reservation, as they mnst have known they would have trouble with either the Indians or the Government. It is hardly probable, however, that they will resist the authorities—more especially as there are so few of them.

AGASSIZ THE YOUNGER.—It may not be generally known that eince Professor Agassiz death his son, Alexander Agessiz, has filled the chair at Harvard, formerly occupied by his father. He is assisted by Connt Pourtales and Col. Lyman, who attend chiefly to the details of the profeesorship. Alexander Agassiz has aleo been placed in charge of the school of natural history on the Penekeese Ieland, near New Bedford. It is now understood that this arrangement will be a permanent one; Agaseiz the yonnger giving every promise of being the most fitting man to fill the place of his lamented father.

THE Consolidated Virginia mine is yielding 400 tons of ore per day. The amonnt of ore extracted has been considerably increased during the past week, for the purpose of creating a reserve for some of the mills away from the line of the railroad, so that, in case heavy snow storms should blockade the roads dnring the winter months they will not bo nnder the necessity of suspending operations.

The Mineral Hill Mines.

We learn from reliable anthority that the Minerel Hill mines, Neveda, which were sold some yesrs ego to an English company, are now looking as well and with more ore in sight than when they were sold, and to all appearances it will be a long time before they ere worked ont. These mines have yielded a good profit in the working since the sale, notwithstanding reports to the contrery.

Some of our readers will recollect that the people on this side of the ocean sold the mine at a fair price, but that the English buyers put it on the English market at sn ontrageous figure, end trouble was the result. The mine was bonght for some $400,000 and put on the London market for about three million dollers. So it could not be expected to pay a very large profit on snch an exorbitant capital.

We mention this fact to show that there aro faults on both sides of the water in the sale of mining property, and that in this case the Nevada people sold a good mine for a reasonable price, while the English buyers floeted it for a sum out of all proportion to its value. This is by no means the first case of the kind; bnt it is high time that English investors recognized the fact thet their own people cen commit these little irregulerities ae well as the Americans. These mines have peid a profit ever since they were worked, never having run behind tho expenses, although at one time the margin wes very small; but there has been considerable trouble with the property, because it could not pay lergo dividends on the enormous capital. It was ststed at one time that the purchesers hed bought a mere shell, and that the mines were worked out; bnt that this essertion was untrue appears from recent developements. The mines were really worth the sum originally paid for them, but not the sum at which they were "floated" by the English purchasers.

DEATH OF D. B. FRINK.—The telegraph brings us intelligence of the deeth of Mr. D. B. Frink, editor and publisher of the Truckee *Tribune*. A secret vigilance committee had been formed in the town, and he was supposed to be a member of the seme. While walking in the street on Tuesdey, between 10 and 11 P. M., he received, without warning, a death shot in the breast by some unknown hand. Report eays he wee *probably* ehot by a vigilante, by mistake. Mr. Frink was an old resident of Nevada City, and well-known in that place and Grass Valley for his industrious and irreproacheble character. He was a good thinker and writer, and a soccessful journalist; the *Tribune* being one of the most frequently quoted locel journale of Californie. A vein of humor accompanied the good sense of much of Mr. Frink's writing. For years peet, some of hie most pungent erticlee have been copied in *Frank Leslie's Journal*, with ideal cute, illnstreting the novel pointe suggeeted. Mr. Frink leavee a grown-up daughter, to whom he has seemed entirely devoted since the death of his wife, some eight ycare since. As an energetic, honoreble man and a true friend, we deeply deplore his lose. And all who knew him well, we dere say, will sincercly feel his death as a personal and public calamity.

BONDED.—We learn from Mr. P. A. Forrester, says the San Luis Obispo *Tribune*, that the Quien Sabe quicksilver mine wae bonded on Wednesday of this week for $40,000, to Mr. E. B. Burdick, of San Francisco. The money to be paid in three installments, within eight months from date of purchaee. This mine sbows excellent prospects, and we have no donbt but Mr. Burdick will count this the most profitable investment that he ever made. We are afraid that San Luie Obispo county will tip soon, ae heavy amounte have been invested in the north end of it in the past year. Four-in-hands will be common in Cambria if this thing continues.

BELCHER AIR SHAFT.—Sinking another air ehaft on the Belcher has been commenced at a point 150 feet west of the one burned out a week or two eince. Thie shaft will be pnshed to completion as fast as it is possible to perform the necessary work, and when it is completed it is hoped that, heing on more elevated ground, the draft or current of air will be turned up and out of the mine, instead of downward, as before.

THE Ophir mine ie yielding 120 tons of ore per day. The company have now three mills crushing ore from the mine—the Empire State, Nevada and Papposse, in Lower Gold Hill. The last named, although a emall mill, will help greatly to swell the net proceeds of the present month.

THE crushing and amalgamating machinery for the new mill for the Consolidated Virginia mine is all in place; the erection of the immense driving engine is fast approaching completion, and the entire mill will be ready to start np in a very short time.

DRINKING FOUNTAIN. — The monumental drinking fountain, erected in Oakland recently, was purchased of the mannfacturer's agent, Capt. J. M. Keeler, No. 306 California street.

THE late rains in Idaho came very opportunely, and mining was commenced with vigor.

The Eocene Epoch in California.

At the last meeting of the California Academy of Sciences, Dr. J. G. Cooper read the following paper on "The Eocene Epoch in California:

Why are no Eocene Fossils Found?

In describing the miocene formations of California I made the remark that no positively eocene fossils had been found here, either marine or terrestrial, indicating a wide gap in the early tertiary age. Two explanations of this have been suggested. One is, that the land embraced in our limits was entirely above the ocean during that epoch, so that no marine deposits could be formed on it. But, if so, the land must have been so extensive that it would almost certainly have had a fauna and flora, like those so richly stored up in the Rocky mountain eocene, and traces of them would surely be found fossil.

The second theory is that the present dry land was then sunk so deep beneath the ocean that such marine animals as live near the shores and have furnished most of the fossils in other formations could not exist, or that the rapid sinking of the rich cretaceous shores, caused so rapid a deposit of sand and mud to accumulate, that marine animals could not flourish. There is some proof that this might have been the case, in the fact that we find great thicknesses of shales and sandstones, above the so-called cretaceous fossils, with no fossils in them except obscure marks, chalk-like tracks or burrows of marine worms and casts of sea-weeds. If sunk very deep, we should find, however, some of the chalk-forming protozoa, still living in the bed of the Atlantic, which are so abundant in the Old World.

Another cause for scarcity of organic life in these beds is suggested in the greater prevalence of volcanic action on the shores of the Pacific than of the Atlantic, by which, during periods of rapid subsidence, the water was probably heated or poisoned through vast extents of the ocean.

I have before stated the evidence to show that during the miocene and pliocene epoche California was constantly rising above the sea, and we have evidence also that this rise was commenced in the cretaceous, from the existence of coal-beds referred to that age, in the strata adjoining to which, we find fossil land plants, and trunks of trees. But as the cretaceous elsewhere was an age of almost general subsidence of the continents, we might rather suppose that after the burying of these coal-beds beneath strata of marine formation, the land would rise still more extensively than before, and, as in Europe, we would have a grand terrestrial eocene fauna, with comparatively narrow deposits of marine fossils along its shores. We find, however, that the old geological divisions of time founded on studies in Europe, are still less applicable here than in the Atlantic States, and there is reason to suspect that while the great and complete change from the cretaceous to the tertiary ages was occuring there, this coast was undergoing a very gradual transmutation, with only partial extinction of the cretaceous life, or a derivation of the tertiary therefrom.

The evidence is so far derived from only a few marine fossils which have been referred by different authors to the cretaceous, the eocene, and the miocene. Conrad, the Nestor of American paleontologists, over twenty years ago, described as unmistakably eocene, a group of fossils, now known as the Tejon group, among which he thought was the *cardita planicosta*, "that finger post of the eocene, both in Europe and America." Mr. Gabb, finding from better specimens that this shell differed from *cardita planicosta*, described it as new, and referred the Tejon group to the cretaceous, finding in it a very few species which he considered identical with the lower beds, proved to be cretaceous by the presence of numerous ammonites. He also stated, in an article in our proceedings, published November, 1866, that "a solitary ammonite represented by half a dozen specimens, has been found by myself, *in place*, even to the very top of the formation." This slender evidence, (which might be rejected after finding a carboniferous fossil in a pliocene deposit,) is all the proof we have of the Tejon beds being cretaceous, and that it is quite arbitrary is shown by the other fossils found with it being nearly all different from the lower ones, less than one-tenth, of the cretaceous shells being common to both according to Gabb, of which several *may be* distinct. On the other hand, many of the Tejon group are scarcely distinguishable from tertiary and living forms. One, *Aturia Mathewsonii* is so near the eocene *A. zigzag*, as to have been taken for it, no other cretaceous *Aturia* being known.

I may add that the ammonite, (*A jugalis Gabb,*) was found by me in a stratum just beneath the Mt. Diablo coal, and apparently on the same level as those from Clayton and "Cnrry's" found by Gabb, so that its existence above the coal, or in the Tejon group, itself, is perhaps accidental. But, to pass by this doubtful era, we have still later strata, referred to the eocene by Conrad, near the mouth of the Columbia, where we would expect the first tertiary to rise near the surface, and this time the eocene *Aturia zigzag*, again appears, though with a different group of shells. Mr. Gabb, while admitting that this time it is the true *zigzag*, is so opposed to recognizing any eocene here, that he calls the formation miocene! The general character of these fossils, of which there are several in the Academy's Museum, shows however, that they are of a more tropical group than any of our miocene species, the *Aturia* itself, being very similar to the *Nautili* now living in the tropics. Though, perhaps, mixed with miocene species among the broken rocks so numerous on the lower Columbia shores; it is most probable that true eocene strata exist there, and, as shown by the Academy's specimens, extend south nearly to California, where later strata cover them.

From all we yet know, we may assume that the gap between the cretaceous and tertiary, so marked on the Atlantic shores, was bridged over in part by the existence here of the "Tejon Group" continuing cretaceous forms of mollusca down to as to be contemporaneous with the eocene epoch there, or the earlier

COMMON MAGPIE.

part of it, just as we find the flora and fauna of Australia, resembling forms fossil in the eocene formation of Europe, but continued to the present epoch. After, perhaps, a short geological period of convulsions and death, we find the eocene mollusca appearing in Oregon, just preceding the miocene, nearly like those of the Atlantic basin.

Though I cannot speak positively on the subject, my impression is that the plants found fossil in our coal measures, are of a more temporate group than those of the cretaceous coal beds of Vancouver's Island, which, if so, will be good evidence of their indicating a newer age.

Have the Poles Changed?

It will appear from the preceding remarks, that it is not necessary to suppose a change of the poles to account for the absence of eocene fossils in California, but I still believe that the existence of tropical and temperate groups of beings within the Arctic circle, in not only the miocene but the carboniferous age, prove either such a change, or the existence of some light-giving medium there in those ages, of which we have no knowledge. It is easy to account for a hot climate there, either by supposing the internal heat of the globe to have been greater, and the amount of radiation less, or by the existence of hotter regions of space through which the solar system was then travelling, but that alone could not produce the vegetation found there.

2. An increase in the obliquity of the earth's position in its orbit could only present each pole alternately to the sun, though more directly than now, so that, while each hemisphere would have six months of greater heat and constant light, they would also have six months of greater cold and darkness.

3. Judging from what we know, a vegetation so much like ours could not exist in a climate very different from ours, for we find entirely different vegetation in regions both north and south of us, having comparatively similar climates. A duration of day or night for months would be as great a change as one of many degrees of temperature. A four months night, with warm climate, would either blanch or decay nearly all growth above ground.

4. The objection that the flattening of the poles proves a permanent position of the earth's axis, although now true, if the earth is nearly solid, need not have been so when it was semi-fluid in the interior, with a thinner crust. Even now, if the earth was to stop revolving, the water must run from the equator toward the poles, and cover them deeply enough to restore nearly the perfect spherical form, at the same time uncovering much of the land now submerged in the tropics. The flattest parts of the sphere would then be the deep bed of the ocean in or near the tropics. The difference between them and the summit of the Andes or Himalayas, is nearly as great as that between the convexities of the poles and the equator.

5. The objection that no cause is known that could produce a change in the earth's axis, is answered by the geological evidence of periodical changes in the elevation of the land, amounting to many thousand feet, which must, it seems, cause a change in the center of gravity of the earth, and a consequent shifting of its axis, not to mention the disturbing effect of the attraction of asteroids, etc.

6. Astronomical observations, extending back only about 4,000 years, may prove that no perceptible change has occurred since then, but cannot concern preceding ages. The earth's present oblique position is itself good evidence that the distribution of land and water have disturbed its axis from a position in which the equator would be always turned directly toward the sun, as in our semi-annual equinoxes.

Common Magpie.

Nuttall, Bonaparte, and Swainson regard the magpie of America and Europe as identical, and Audubon approves their judgment. Its range is general throughout Europe, but in this country it is restricted to the northern and western regions. It is stated by Dr. Richardson that it has not been seen nearer to the Atlantic on this continent than the head of Red river, in Louisiana. It dwells in the far countries of the North in winter as well as in summer, and is a common resident of the interior of Texas, Western Louisiana, Arkansas, and Missouri. It suffers from the want of food, but not from cold, in high northern latitudes, where travelers have been almost unable to protect their galled horses from its assaults. Unlike the magpie of Europe, it then has little fear of man, the young especially coming to his encampments or habitations, and greedily devouring whatever food they can obtain, even from his hands. The raven is often its companion, but the crow is not found with it.

In the central table-land of the Rocky mountains, the nests of the magpie may be seen, usually in low, thick bushes, barricaded over and floored with interlaced twigs; and it is common in many parts of this State. Its common call is *pay pay*. When approaching each other, they practice a low chatter, but utter a monotonous and gluttonous croak while eating.

The account of the habits of the European magpie, given by Macgillivray, is recited by Audubon in trusting of the American bird. He states that its food consists of testaceous moluscs, slugs, larvæ, worms, young birds, eggs, small quadrupeds, carrion, and sometimes grain and fruits of different kinds, in search of which it frequents the fields, hedges, thickets, and orchards; it occasionally visits the farm-yard, prowls among the stacks, and perches on the house-tops, whence it sallies to examine any attractive spot. It is probably unjustly accused of picking out the eyes of lambs and sickly sheep; but it eats eggs, or the young of chickens or ducks, when the old are not present to repel it. Its more wary character, in Europe, is the result of the persecution it experiences because of its depredations.

The magpie walks like the crow, but often leaps in a sidelong manner. It is prompt to apprize its companions of the approach of danger, which it does by a chatter indicating its own fears.

The eggs of this species are from three to six in number, and vary in form and color. In general, they are regularly ovate, or a little pointed, more than one and a half inches in length, and nearly or quite an inch across. They are frequently pale-green, freckled all over with umber-brown and light-purple, and sometimes pale-blue or bluish-white, or greenish-white, with smaller spots and dots of the same dark colors, so as very nearly to resemble the eggs of the jay, which, however, are smaller.

SUPERINTENDENT MULLET.—Quite a sensation was created in Washington, a few days since, by the announcement that Supervising Architect, Mullett, had resigned his position, rather than surrender to Secretary Bristow the control of the contingent fund, amounting to $100,000, although the law places the fund under the control of the Secretary. It is said, however, that the real difficulty grows out of the extravagant ideas of Mr. Mullett, in regard to construction of public buildings. Secretary Bristow is opposed to expending enormous amounts of money for such purposes, when a much smaller amount will answer, and still gives us substantial buildings of good architectural proportions and construction. The people will sustain the Secretary by acclamation, and the President dare not interpose, notwithstanding his great partiality for Mr. Mullett and extravagant architecture. It is said that any interference in favor of the retiring architect will be met by a prompt resignation from the spunky Secretary, who knows he is doing right in the eyes of the whole country.

THE JETTY SYSTEM OF IMPROVING RIVERS.—The plan of improving the navigation of rivers, particularly at their months, by compelling, through artificial means, large quantities of water to flow through narrow channels, is proving a great success in the Eastern world. This system has proven a success in every instance, when it has been properly applied. The depth of rivers has been thus permanently increased in some cases from five to fifteen feet. The system has been applied even to the Danube, one of the largest rivers in the world, with the most complete success, and now it is proposed to apply it to St. George's channel, which discharges four times as much water as the Danube. Russia is also preparing to apply it to the Volga, the Dwina and the Neva. And now it is proposed to apply the same system to the mouth of the Mississippi. The improvements now in progress at the Oakland harbor improvement are founded on the same principle, and can scarcely fail of meeting the most sanguine expectations of their projectors.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents aud Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the varions inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than auy other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will iuterfere with their obtaining a patent.

We invite the acqnaintance of all parties connected with inventions aud patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in douht in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable iscooveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 224 Sansome St., S. F.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY OO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick silver. 1870.

This rare hook on the treatment of gold and silver ores without quicksilver, ie liherally illustrated and crammed full of facts. It give short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatue.

It la a work of great merit, hy an author whoee reputation is uneurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographio Diagrams. 1867.

This work is unequaled by any other published, embracing the aubjects treated. Its authority is highly esteemed and regarded by ite readers; containing, as it does, much eesential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot he found elsewhere in print. It also abounde throughout with facts and instructions rendered valuable by being clearly rendered together and in eimple order. It containe 120 diagrams, illustrating machinery, etc., which alone are of the greateet value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially or the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operatione connected with silver and gold from a preliminary examination of the oro to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein minere and workers in precioue metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Oloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Oo. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will he furnished at the most reaeonable rates by DEWEY & Co., Mining and Scientific Presa Office, S. F.

Hints to be Remembered.

A note datod on Sunday is void.

A note obtained by fraud, or even from one intoxicated, can not he collected.

If a note he stolen it doee not release the maker—he muat pay it.

An indorser of a note is exompt from liability, if not eervod with notice of its dishonor within twenty-four hours of its non-payment.

A note hy a minor ie void.

Notes bear interest only when so stated.

Principals are responeible for their agents.

Each individual in partnership is responeible for the whole amount of the debte of the firm.

Ignorance of the law excuses no one.

It ie a fraud to conceal a frand.

The law coinpels no one to do impossibilities.

An agreement without consideration is void.

Signaturea in lead pencil are good in law.

A receipt for money is not legally conclusive.

The acte of one partner bind all the others.

Contracts made on Sunday can not be enforced.

A contract made with a minor is void

A COMPLIMENT.

PLAINSBURG, MEROED Co., CAL., June 22, 1874.

DEWEY & Co.—*Gentlemen:* I herewith tender my grateful acknowledgements for the energy, promptness and efficiency which you have displayed in procuring my patent.

Although you were entire strangers to me when I first communicated with you, I soon felt eatisfied you were gentlemen of integrity, and shall alwaye be happy to represent you as such. Very truly youra,

H. W. RUOKER, M. D.

Wood Cuts for Sale.

We are willing to eell a large number of the wood cuts and electrotypes which have appeared in the PRESS, on very liberal terms to publiehere abroad, and would invite correspondence on that business.

The Mining and Scientific Press--Ever Onward.

Our careful eystem of compiling, judiciously condensing, and conveniently arranging into regular departments, hae been heartily endoreed. It rendere the paper worth more to readers, who can find handily that which interests them moet.

The weekly iesuee of the PREES will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Oree; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mince; Mining Engineering and Hydraulice.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturere; Illustrations of New Machinery; Reports of Popular Scientific and Indnstrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the variona countiee and districts throughout the principal mining regions of the United States, arranged in alphahctical order. It is the most extensive record of mining operatione publiehedin the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operatore and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should he known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS is not strictly a "paper for professional scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically eclentific men from our intelligent masses. This ie our stronghold for accompliehing good. Plain, correct and pleasing language, eesily comprehendod hy all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and naturos and progressive intollects of both men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the editore and proprietors during their long connection with the PRESS. Our paper presents

The New and Novel Developments

In the progress of this comparatively new section of the Union (hut recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhore. The same circumstances also render such a paper more especially valuable to its readers in a new, and, to a certain measure, untried field, where the hest methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

In hrief and fresh form, suited to the wants and tastee of the readere of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stande preeminent and without a precedent.

Subscriptions payable in advance—$4 per annum Single copies, post paid, 10 cents. Addrese

DEWEY & CO.,

MINING AND SCIENTIFIC PRESS and PACIFIO RURAL PRESS Office, 224 Sansome St., S. F.

Hints about Advertising.

If you have goods to eell farmers, how much hetter will it pay you to advertise in a farming paper, closely read by 15,000 intelligent farmers, than in miscellaneous daily or weekly journals with 30,000 readers, comprising only 2,000 farmers. A mining journal in California with 15,000 readere reachos more intelligent minors than any other 10 papers in the Union.

Purchasers are more likely to look for information in the advertising columns of a paper devoted to their special interests, than elsewhere, when ready to buy. Some will not read advertisements upon any other occasion, but eeek the hest paper when wanted.

If you happen to be the only advertiser in your line of business in a paper, all the hetter. But if several firms advertise the same, your own judgment will question whether you can best afford to go unrepresented.

Weekly journals are read most leisurely and carefully, and at a time when the subscriber ie most favorably inclined to examine advertise ments. The newspaper most apecially representing you particular branch of industry is nanally best enti..ed to your patronage, and the most profitable medium you can employ.

An advertisement in an honest and handsome sheet is favorable to the reputation of the advertiser. The readers of the PRESS are a superior and industrious class, who are able to purchase and who seek to patronize the best and fairest dealing tradeamen.

Advertising in cheap priced mediums (of limited circulation) is like huying goods at retail when you could as well take them at wholesale.

Information imparted to a list of superior and intelligent and active and industrious readers (naturally looked up to hy others for information), is seed sown in good soil for the advertiser.

Fame and fortune are gained, nine times in ten, by liberal and judicious advertising.

THE SCIENTIFIO PRESS.—This valnable jonrnal entered upon the seventeenth year of its publication on the 4th of July. The steady advance in character, that every reader has noticed in the paper, renders it unnecessary to make any aplurge of improvement, and the publishers simply content themselves with the announcement that they will continue to make their paper as intereeting as poesible. That it is interesting to a large claes of readers, the wide circnlation and extensive influence of the PRESS, is sufficient evidence.—*Placer Argus.*

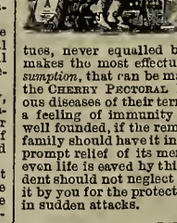
For Diseases of the Throat and Lungs, such as Coughs, Colds, Whooping Cough, Bronchitis, Asthma and Consumption.



The few compositions, which have won the confidenco of mankind and become household words, among not only one, bnt many nations, must have extraordinary virtues. Perhape no one ever secured so wide a reputation, or maintained it so long, as AYER'e CHERRY PECTORAL It haa been known to the public ahout forty years, hy a long c ntinued series of marvellous cnres, that have won for it a confidence in its virtues, never equalled by any other medicine. It still makes the most effectual cures of *Coughs, Colds, Consumption*, that can be made by medical skill. Indeed the CHERRY PECTORAL hae really robhed these dangerous diseases of their terrore, to a great extent, and given a feeling of immunity from their fatal effects, that is well founded, if the remedy he taken in season. Every family should have it in their closet for the remedy and prompt relief of its members. Sickness, suffering and even life is saved by this timely protection. The prudent should not neglect it, and the wise will not. Keep it by you for the protection it affords by its timely use in sudden attacks.

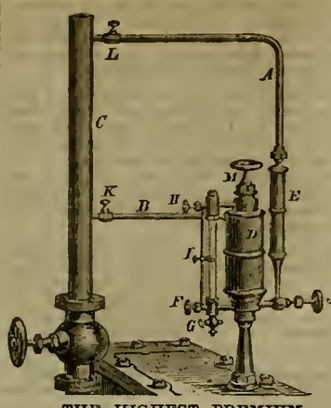
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricatore are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23t

BALL'S

SWEEPING DREDGE,

A NEW AND VALUABLE

CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merit.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setters for themselves, at the office, 229 Fremont Street, San Francisco

The Juice of California Grape as Adapted to Wine Making.

[A paper read before the Oslifornis Academy of Sciencee by James Blake, M. D.]

Having, whilst in El Dorado county, tasted some wine which was evidently superior to anything I had before tasted, as the produotion of our State, I inquired of the maker the variety of grape from which it was made, and found that it had been made principally from a grape known in this conntry as the Zinfindel. Since my return, I have made an analysis of the jnioe of this grape, and also of some otbers which are now bsing propagated for makiug wine. The grapes were grown at the vineyard of the Vinicultural Society at Sonoma, and were apparently perfectly ripe. The varieties analized, beside tbe Zinfindel, were the Reimer, a large white grape; the Riessling, also a white grape, and the Oalifornia Mission grape. The method of analysis was to take the sp. gr. of the juice—heat it to ooagulate the albuminous matters, filter through a Bunsen filter, and after bringing up the juice to the original quantity, to neutralize with a standard solution of potash or ammonia, so as to ascertain the total amount of free acid. Another portion of the juice was evaporated to about one-third, mixed with alcohol and ether to precipitate the tartrates; Tbe ether and alcohol distilled off from the filtered juice, which was then neutralized to ascertain the amount of malic acid. The amount of sngar, as indicated by tbe sp. gr., was controlled by direct analysis of a portion of tbe juice cleared by acetate of lead by means of Febling's copper teet; and the result tbus obtained is that recorded:

	Sp. gr.	Sugar.	Free acid.	Malic acid.
Zinfindel	1072	16.8	1.73	0.60
Riessling	1083	18.7	1.10	0.57
Reimer	1057	14.0	1.30	0.80
Mission Grape	1088	21.5	0.60	0.11

As there can be but little doubt that the development of the ethereal substance on whicb the aroma of wine depends is owing to the presence of free malic acid, and more particularly, I believe, of malio acid, the above figures explain the cauee of the absence of aroma from the wine made from tbe juice of the Mission grape; for wbilst the three varietiee of foreign grapee analyzed contain respectively 60.57 and 80 parts of malio acid to 10,000 parts of jnice, the Mission grape contains but 11 parts. The presence of this comparatively large portion of malic acid in grape juice is a fact which has not I thiuk received tbe attention it deserves. I believe the acid itself splits up into an etber and an alcohol; aud this independently of its action on the alcohol already found in the wine. Wialicenus has sbown that lactio acid forms an ether even when being dried at or dinary temperaturee over snlphuric acid, and alcohol is one of the producte of tbe fermentation of malic acid. There wonld seem to be enough potash in the grape juice to form with the tartaric acid the slightly soluble bitartrate of potash, as after this has been precipitated by alcohol and ether, and the juice then nearly neutralized with potash, no more bitartrate is thrown down by again mixing the juice with alcohol and ether, but malate of potaeh separates as a thick cyrupy depoeit.

Theee figuree as far as they go, give, I think, a satiefactory explanation of the superiority of the Zinfindel ae a wine-producing grape, and fully bear out the conclusione I expressed eome 14 yeare ago, in a report I drew up as one of a oommittee for examining the wines at the Agricultural State Fair at Sacramento, in 1860. As theee remarks contain suggestione which I think will be useful to our wine-growers, I sball offer no apology for quoting them. After pointing out the great advantages as regnrds climate and soil found in our State for cultivating the grape, and which I believe ensure its being the finest wine-producing country in the world. I remarked on the imperfect manner in which these advantages had bsen utilized by our wine-growers, as indicated by the quality of the wines exhibited, and poiuted out what I then considered to be the cauee of our want of euccess; observing "in view of these faots yonr committee believe that tbey are authorized to call the serious attention of our wine-growere to the necessity of an early introduction into this country of varieties of foreign grapes which appear to possess those qualities wbich are wanting in our own, or in other words which contain less sugar and more free acid." After mentioning some of the varieties of European wine grapes which poeeessed these qualities, I remarked "it ie highly probable that the grape now cultivated in thie State is about the worst that would be selected for making a first-olase wine." The truth of this remark is now being realized by our wine-growers, wbo are replacing as fast as possible the Missiou grape by foreign varieties, for it is found that even where a portion of these foreign grapes are used in tbe manufacturing of the wine, it commands a much higher price thau tbat made with the Miesion grape. I believe tbat either of tbe varietiee, the analyeis of which I have made, ie capable of making a good wine when the soil aud climate to wbich it is most suited is properly selcoted, of the necessity of paying some attention to the eelection of the variety best suited to tbe very marked varieties of our eoil and climate. I quoted the following remarks of Mr. Bender, Inspector-General of Agricnlture, in France, and author of a work on the vineyards of that country. After describing 144 varieties of grapes that are grown for making wine, he says: "Almost every variety of soil is found in our more celebrated vineyards, and appears able to furnish a superior wine when the variety of grape cultivated has been well selected, that is, when it is perfectly appropriate to tbe soil and climate. The choice of the proper variety of grape that will suit the soil and olimate is after all the great secret for obtaining superior wines iu a climate where the grape flourishes." That so little success has up to the preseut time attended the efforts of onr wine growers to produce a first-class wine is not surprising when we consider that not only have they been working with probably the worst grape for the production of such a wine, but have been endeavoring to make the same grape produce good wine in tbe moist alluvial soil of Los Angeles, and in the heated volcanic hills of the Sierras. [I would observe that the Zinfindel from which tbe wine I tasted was made, wss grown near Coloma, and I believe on a soil of decomposed granite.] A long experience, however, will be required to discover the most appropriate variety of grape suited to our varied conditions of soil and climate. As showing the influence of soil and climate on the qnalities of the grape, it is interesting to compare the analysis of the same variety of grape when grown in Germany with those grown here. Iu Watts' Cbemical Dictionary I find an analysis of the juice of the Riessling made in Germany by Freeenius. The quantity of sngar is there given as 15 per cent., and of free acid ae 53 per cent., whilst here the juice contains 18 per cent. of sngar and 1.10 of free acid or three per cent. more sugar and twice as much free acid. Sbould the presence of the free acid influence the quality of the wine in the manner I have poiuted out, it is evident that the Riessling may make a superior wine here to that made from it in Germany; that is, when grown iu the localities which suit it.

General News Items.

A Good Inea.—The Sacramento *Record* says: In the Catholic church, the other day, the priest officiating gave notice that he wnnted the names of the boys and girls who have just left scbool and want employment, that the plan of finding employment for youths had been accepted by that church all over tbe State. He also desired people wishing to employ boys or girls to notify him.

Oaklann Library.—Thie library bas recently moved into new quartere, near the City Hall, Oakland. The library now contsios about 4,000 volumee. On Friday night last there was a social meeting of the intelligent oitizens of Oakland, on the occasion of the opeuing of the new quarters. The library is now in a prosperous condition.

Philosopher Pioett still languishes in jail. The Virginia *Enterprise* comments: "Pickett hae been for mnny yeare considered little else than a half-crazed, harmless old man, nud it is simply unworthy tbe dignity of the California Supreme Court to persist in wreaking vengeance upon such a helpless object."

Granges iu Wisconsin have on hand $250,000 toward a State Agricultural Implement Society. They have already established 41 cooperative associations for selling goods and manufacturing, and 29 iusurance companies, all flourishing, and representing capital to tbe amount of $4,000,000.

Mammoth Beef.—A Short-born steer was butohered laet week in Detroit that weighed 4,110 pounds alive; weight of dreseed beef, 3,000 pounds; hide, 130 pounde, and rough tallow, 300 pounde. This ie supposed to be the largest animal ever slaughtered for beef on this continent.

Cheap Foon.—The London *Agricultural Gazette*, in an article on the Englieh crops eays that "wheat hae yielded so abundantly everywhere this year that it ie now one of the cheapest foods in the market, cheaper probably than oats or barley, cheaper than Indian corn or oil-cake."

A Baptiet Church in Gallatin, Tennessee, bne decided that a Granger cannot remain a member of that church while he is a member of the Order of Patrons of Hnsbandry. The ground assumed by the church is that the Patrons of Husbandry is a secret order.

A Granoe Wagon Road.—It is reported that the Rogue River Patrons of Husbandry propose the construction of the proposed wagon road from the head of Illinois valley to Chetco harbor, on the coast, and that the eurveyore are now marking out tbe line of the road.

Drowned in a Well.—George N. Murray, living on Valencia street, in this city, miseed his son, five years old, on Monday of laet week. On Wednesday evening he fonnd him dead in the bottom of a well, not far from the house.

Somebony Saye.—"California ie the nobleet State in the Union. Sonoma county ie the choicest part of California. Cloverdale is the lovlieet spot in Sonoma county. Therefore, Cloverdele is the nicest place in America."

Honey in Ren Woon Boxes.—Several late consignmente of honey, packed in green or new redwood boxes, have arrived at San Francisco in a badly damaged condition.

There are forty iron sbips now at San Francisco—a much larger number than was ever there before.

A Lany in Newport has a ring out out of a solid diamond. It is said to be the only one in the country.

Heavy Fog.—England and Scotland were enveloped in such n dense fog on Satnrday and Sunday last that no steamboats conld run on the Thames during these two days. At Liverpool forty boats stopped. Railroad accidents are reported at Wolverhampton, Shrewsbury, and elsewhere. At Newport, in Monmouthshire, a railroad collision occurred, and fourteen persons were injured. The fog was still hanging over London on Wednesday.

Robbery on the Cliff House Road.—A gentlemen, with two ladies, in a buggy, wae stopped on the Cliff honse road a few evening's since, and robbed of his valuables. The robbers also compelled the occupants of the carriage to alight, when they jumped in and drove into the city. Tbe gentleman and ladies were compelled to take a long moonlight walk to tbe nearest street car.

The Pacific Mail S. S. Co. seems to be in a flourishing condition just now—full of passengers and freight, and rapidly increasing their facilities for bueiness. The increase in the nnmber of passengers carried during the month of October over those transported during the corresponding month of last year, was 1,129.

Chinamen Voting in British Columbia.—Eight Chinamen voted for members of the Local House nt Victoria, B. C., at the recent election. Their votes secured the success of the opposition ticket. These Chinamen are regularly natnralized British subjects.

Elections in France.—Tbe Republicans were everywhere successful in France at tbe elections on Sunday last. The Imperialists are much discouraged at the result, and Count Chambord has resolved to issue another manifesto to prop up his failing fortuues.

Bold Robbery.—A young man nsmed Browu was savagely attacked and robbed at the corner of Pncific and Kearny streets on Tuesday night. The supposed robbers were arrested ahout an hour later, only about two blocks distant from the scene of the robbery.

Incendiary Fires.—The city of Cronstadt, Ruesia, suffered from a severe iucendiary fire a few days since, and now letters have come to hand threatening similar outragee in otber Russian cities.

Grape Shipments.—Tbe Vallejo *Chronicle* learns that 912,498 pounds of grapes were shipped from St. Helena last montb. Total shipments for the season, 1,374,185 pounds.

Barley in Los Angelos.—A sale of 2,600 sacks of barley wae made this week at the cooperative warehouee, Willmington, Los Angelos county, at $1 per cental, cash.

Nevada, having the emallest population of any State in the Union, will have the two richest men in the whole United Statee Senate.—*Springfield Republican*

It is said tbnt one of the first pbotographers of the United Statee, aud who made a fortune of over $100,000 in San Francisco, is now a high private in the ranks at Mare Island.

The Paris correspondent of tbe London *Times* writes that a better feeliog seeme to have sprung up between the governments of France and Germany.

Severe Storm on Lake Erie.—One of tbe most severe etorms ever known on Lake Erie was experienced on Wednesday. Much damage was done to shipping.

Notary Appointen.—Governor Booth has commiesioned Alonzo Rhodes as Notary Public for San Joaquin county, Cal.

Forney's *Press* bas been sold to Marshall O. Roberts, tbe millionaire steamship owuer, of New York.

Bog Oranges is a fancy name given to potatoes np in Sierra conuty.

The Inyo *Independent* saye it eeems that the new road from San Bernardiuo to Panamint is very nearly impracticable. There ie one stretcb of ninety miles in whioh water cau be had in bnt one or two places, and the sand is so heavy that the brake blocks of wagons drag the ground a long way at a time.

A reift running sonth on tbe ore vein in the Dayton mine, on the Comstock, toward the Kossutb line, has penetrated the ore body a distance of 100 feet, at which point a croes-cut hae been made, which ehows the ore body to be 24 feet in width, and of a much richer character than that opened at the turn-table slopes.

The new pumping engiue at the Julia mine, on the Comstock, hae a capncity of 200 horsepower, and the shafts of the hoisting and pumping engines are so arranged that in case of a continnous heavy flow of water they can be coupled together and the power of both enginee combined to reduce it.

The east ore body on the 1,500-foot level of the Crown Point mine is opening up much better than was expected, and promises a fine yield of rich ore.

A Thousand Bankruptcies—Would not create as great a panic in commerce as the withdrawal of *Hale's Honey of Horehound and Tar* from the market, would create among the sick. The reason is obvious. Tens of thonsands of both eexes would be hankrupted in health by such an event. The famous specific is effecting such curee in cases of chronic congh and cold, Influenza, bronchitis, bleeding from the lungs, and apparent consumption, as have never heretofore been accomplished within the memory of man.

Pike's Tooth-Ache Drops—Cnre in one minute.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Nov. 24th, 1874.

For Week Endino Nov. 10th, 1874.*

Olon Breaker. — Addo Borchers, Albany, Oregon.

Portable Cutting Table.—Benjamiu Strawbridge, Stockton, Cal.

Coal-Oil Stove.—Benjamiu R. Sweetland, Sacramento, Cal.

Horse Detacher.—Anatole Ehret, Telegraph City, Cal.

Sash Fastener.—Bartlett Doe, S. F., Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

From an Inventor.

The following letter, which was recently received from an old client of Dewey & Co., now residing in one of the Eastern States, speaks for itself, and will do more, perhaps, to convince inventors of our capacity for business than any number of local compliments. We extract as follows:

Gentlemen: It was through your house that I secured my first patent, and although I have since done business here in the Atlantic States with the ablest patent solicitors—gentlemeu who have done me justice—yet I have often regretted that you were too far off to advise with me in my cases. It has taken a longer time with every patent I have taken out since I left California and came East, than in the cases you prepared for me in San Francisco, which is certainly very creditable to you.

By the way, one of my patents has passed the ordeal which is the essential test of a patent's value. I mean that of a trial in the courts, and it stood the battling of one of the best lawyers in the country. The specifications and claime were completely made out and there was a perfect comprehension of its principle during the trial. Since giving it this test we thought that we would make it even stronger, if possible, and submitted it to one of the best patent solicitors for advice. After a careful examination of the case he advised us to let it alone as it stood, saying that whoever made up those papers nnderstood their business. I then informed him that they were drawn up by Dewey & Co., of San Francisco, and he replied that he knew you well by reputation. * * * * * Very truly yours,

L. L. Sawye

Meriden, Conn., May 16,

Goon Prospect.—Tbe lode known as the Spanish lode, at Yeomet, is turning out very fine rock indeed. The ehaft is now down 180 ft., with a well defined ledge, rich in free gold. What is a little singular, up to, or rather down to the depth of near 180 ft., not a single atom of gold could be discovered in the rock taken out in einking, but on reaching tbe depth above named, gold eeems diffused through the entire ledge, much of the rock being remarkably ricb. It is the intention of Mr. McKillican to eink still deeper and to thorougbly prove the mine, and with this object, he is now putting up steam hoisting works. The mine at the present depth we are informed looks promising.

It ie stated that tbe English company wbo have purchased the soda mine near Buffalo Salt Works, in Lassen county, will erect extensive worke there next spring.

Five locatione on a cinnabar ledge were made in the mountains laet week, about sixty miles above Sonora, and three miles west of the Middle Fork of the Stanislaus river.

The Henry Mining Company, near Marshfield, Coos conuty, have three veesels chartered to take their coal, and are endeavoring to secure some steamers.

The Inyo *Independent* says tbat the proper name for Independence ie now the Deserted Village, as everybody ie off for Panamint.

The Olive mine, Sonoma county, last week shipped four tons of copper to San Francisco, to be crushed and sampled.

The Pbœnix Mine, in Napa county, is mining at the rate of 100 flaske of qnicksilver per month.

The Mission of San Diego ie the oldest in the State, having been established July 16, 1769.

E. E. Staoy has heen elected recorder of the Calistoga mining district.

Travelling Agent East.

Mr. Wm. C. Quinby will act as agent for thie paper in New York and other Eastern and Western cities. Business men will find a favorable opportunity to patronize the Press whenever he calls. 1m

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the Continent. Its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

The Mining & Scientific Press

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing, a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

AS A PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Miners, Assayors, Millman, and Metallurgist in the United States should take it.

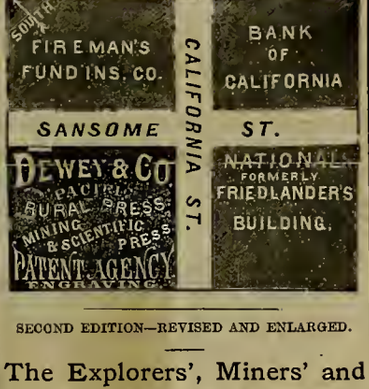
Pacific Coast Mechanics, Engineers, Inventors, Manufacturers, Professional Men, and Progressive and Industrial Students should patronize its columns of fresh and valuable information.

Mining Engineers, Superintendents, Metallurgists, Mine Owners and Mine Workers throughout the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Intelligent thinkers throughout the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,
No. 224 Sansome street, S. F.

Location of Dewey & Co.'s New Offices since July, 1874.



SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

Our Agents.

OUR FRIENDS can do much in old of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

HOON ALSTON—San Luis Obispo, San Bernardino and San Diego Counties.
JAS. KEARNEY—Amador, Calaveras, Tuolumne and Mariposa Counties.
B. GOONWIN—Sacramento County.
S. G. CRAWFORD—Nevada, Sierra and Plumas Counties.
J. G. KELLEY—For Washington Territory.
B. W. CROWELL—California.
F. B. ALDERSON—Nevada.

CAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

THE MINING AND SCIENTIFIC PRESS, San Francisco, we regard as the best paper for miners published anywhere in the world. Subscribers should be careful to put on file each number; and each year's edition, bound in a volume, would prove a most valuable book to all reading men engaged in mining or in the reduction of ores.—*Boulder News.*

SEND FOR CIRCULAR.

The Pacific Rural Press

Is a Large and Handsomely Illustrated Agricultural Home Journal; Original, Instructive and Attractive; its varied contents, ably written and condensed, render it popular with its readers. We endeavor to make it a credit to the field it occupies, and to every intelligent circle it enters. ENTIRELY FREE FROM POLITICS, its columns are filled with cheerful words of encouragement for our Pacific Industries and instruction for the people. It extends information of the growing wants and necessities of our rapidly increasing and progressing agriculture. You can read it with pleasure, for present and future profit; you can send it with satisfaction to your friends anywhere. Its editorials are earnest and its contents reliable. No questionable advertisements darken its pages. It is a journal for rural homes throughout the Coast. It is a handsome home print, without a rival on this half of the Continent. Subscription, in advance, $4 a year.

FROM AN INVENTOR.

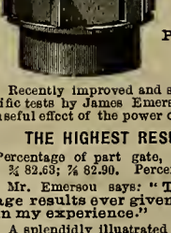
PLACERVILLE, October 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* Yesterday I received from you my Letters Patent for my Hydraulic Mining Lamp, and I herewith tender you my grateful acknowledgements for the energy and promptness which you have displayed in working said invention through the Patent Office for me; and shall in the future, as well as the past, recommend all parties having new inventions, to go direct to the office of Dewey & Co., and ask for Mr. Boone, in the Patent Department, and if he cannot procure a patent for them they will find it useless to try further. Yours Respectfully, C. B. BROWN.

AGENTS WANTED to canvass every town on the Pacific Coast for the MINING AND SCIENTIFIC PRESS, PACIFIC RURAL PRESS, and the ILLUSTRATED PRESS. Experienced canvassers preferred. Good men can make large wages besides learning much and improving their talents

TRUCKEE, CAL., July 10, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* My patent is just received, and is entirely satisfactory. Permit me to tender you my sincerest thanks for the care and attention, the promptness and interest you have displayed in managing my affairs. Gratefully yours
C. F. MCGLASHAN.



THE AMERICAN

TURBINE

Water Wheel.

Power Pledged Equal to any Over-shot Wheel Ever Built.

Recently improved and submitted to thorough scientific tests by James Emerson, showing the following useful effect of the power of the water utilized, being

THE HIGHEST RESULTS EVER KNOWN.

Percentage of part gate, ¼ 50.08; ½ 69.64; ¾ 78.73 ⅞ 82.63; ⅞ 82.90. Percentage of whole gate, 83.14.

Mr. Emerson says: "These are the best average results ever given by any Turbine Wheel in my experience."

A splendidly illustrated descriptive catalogue, or any further information desired, furnished on application to

TREADWELL & CO.,
SAN FRANCISCO, CAL.

Sole Agents for the Pacific States and Territories.
18v29-eow-tf

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. 1amhp

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect **July 1st, 1874**, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.
June, 1874.

Mining and Other Companies.

Land Purchasers' Association—Office, No. 331 Montgomery street, Room 7, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Directors or Trustees of this corporation, held on the 28th day of October, 1874, an assessment of ten dollars per share (being the 42d monthly installment on the subscription to the stock) was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at No. 331 Montgomery street, Room 7 San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of November, 1874, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the 24th day of December, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

C. S. WRIGHT, Secretary.

Office, No. 331 Montgomery street, Room 7, San Francisco, California.

☞This assessment is levied to pay the taxes on the property for 1874 and 1875.

Mansfield Gold Mining Company—In accordance with a resolution adopted at a meeting of the Board of Directors of the Mansfield Gold Mining Company, held this day, a special meeting of the stockholders of said company is hereby called, to be held at the office of said company, in San Francisco, No. 531 California street, room 1, on Monday, the 21st day of December, 1874, at 1 o'clock P. M., to take into consideration and act upon the proposition to increase the capital stock of said company from nine hundred and ninety thousand dollars, divided into thirty-three thousand shares, of the par value of thirty dollars each, to one million, nine hundred and eighty thousand dollars, divided into sixty-six thousand shares, of the par value of thirty dollars each. Also for the transaction of any other business that may properly come before the meeting.

R. COULSON, President.

And in accordance with law, and an order of the Board of Trustees, made on the 16th day of October, 1874, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, room 8, No. 315 California street, San Francisco, California, on Tuesday, the 15th day of December, 1874, at the hour of one o'clock P. M., of such day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

F. P. WESMITH, Secretary.

Office—Room 8, No. 315 California street, San Francisco, Cal. no28-2t

Owens Gold and Silver Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Julian Mining District, San Diego County, Cal.

Notice is hereby given, that at a meeting of the Directors held on the second day of November, 1874, an assessment (No. 3) of one dollar per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, room 4, Hayward's Building, No. 419 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the seventh day of December, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 28th day of December, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

FRANK SWIFT, Secretary.

Office, Room No. 4, Hayward's Building, No. 419 California street, San Francisco, California. no7-5t

Virginia Consolidated Mining Company.

In accordance with a resolution adopted at a meeting of the Board of Directors of the Virginia Consolidated Mining Company held this day, a special meeting of the Stockholders of said Company is hereby called, the same to to be held at the office of the Company in San Francisco, No. 318 California street, Room 13, on Monday the 21st day of December, 1874, at 2 o'clock P. M., to take into consideration and decide upon the proposition to increase capital stock of said company from three million dollars, divided into thirty thousand shares of the par value of one hundred dollars each, (the present capital stock,) to six million dollars, divided into sixty thousand shares of the par value of one hundred dollars each. Also, for the transaction of any other business that may properly come before the meeting. By order of the Board of Directors.

AUG. CHEVIOT,
ROBT. P. CHASE,
A. F. BENARD.
} Directors.

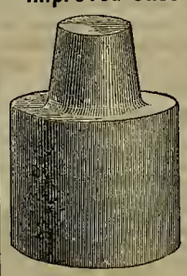
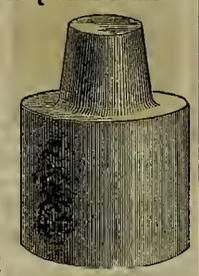
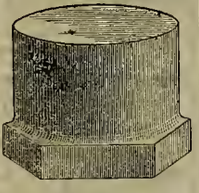
Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.
[PATENTED MAY 26TH, 1874.]
Prics Reduced to 16 Cents Per Pound.
SAN FRANCISCO, November 10th, 1874.
To Supts. of Quartz Mills and Mining Men generally:







We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.
Address all orders, with dimensions, to
1v29-3m CAST STEEL SHOE & DIE CO., Room 1, Academy Building, S. F.

Froiseth's New Sectional, Topographical and Mineral
MAP OF UTAH.
SIZE, 40 BY 56 INCHES; SCALE, 8 MILES TO AN INCH.
Handsomely engraved on stone, colored in counties and mounted on cloth, showing the Counties, Towns, Rivers, Lakes, Railroads, Mines and Mining Districts throughout the Territory, and all GOVERNMENT SURVEYS made to date. Price, mounted, $8; Pocket form, $5.
—ALSO—
New Mining Map of Utah,
Showing the boundaries of the principal mining districts, some 30 in number, adjacent to Salt Lake City. Price, pocket form, $2.50.
—ALSO—
Froissth's New Map of Little Cottonwood Mining District and Vicinity.
Showing the location of some 400 mines and tunnel sites, together with the mines surveyed for U. S. Patent. Price $3. For sale and mailed to any part of the globe, on receipt of price, by A. L. BANCROFT & CO., A. ROMAN & CO., and LECOUNT BROS. & MANSUR, San Francisco. 10v25-tf

New Inventions!
Of real merit, if brought plainly before the public when fresh, are most likely to become profitable to the patentee. For this reason, patentees (of worthy devices) should have the best of Engravings Made, and published in the PRESS. Superior Engravings Made, at reasonable rates, by artists in this office. bp-tf

Sugar in California.

It is highly probable that the southern counties of the State, or particular portions of them, may, through irrigation be favorable to the growth of the cane. It is not of this that we would now write, but rather of the cultivation of Beet Sugar, and its industrial importance to the State. The production of first-class Sugar from Beets, has long been a success in continental Europe, and has to a certain extent revolutionized the Sugar trade of that continent. It has not entirely superseded Cane Sugar there, nor is it in the nature of things that it ever should, as people will have variety in articles of food, dress, etc., no matter what the cost—under any and all circumstances. For instance French, Spanish, etc., Wines will be always in demand in California, though the State itself should produce thousands of millions of gallons. But the production is so great in some European countries, that it has become one of the principal farming staples, that whole towns are employed in its manufacture, and that in some cases, as in that of Austria, not only is there made sufficient for home production, but there is a large surplus for export.

Until recently it was complained that California Beet Sugar possessed an unpleasant flavor, and there was no doubt of the fact, but improved manipulation has done away with all this, and the samples of all this year's production that we have seen, can, in no way be distinguished from those of the best refined Cane Sugar. Indeed it is claimed that in some points they are far superior, and that at the same price they are more economical and cheaper. But apart from this it has been conclusively shown that Sugar inferior to none in the market can be made from California Beets. The quantity made this year will be but small, but there is room for immense development of the business.

California, and that part of the Pacific Coast which receives its supplies through San Francisco, consumes annually 66,000,000 lbs of Raws, the purchase money of which paid away to the planters of the Philipines, Central America, Java, China, and Peru is equal to $2,500,000. With duty superadded, the whole cost is not less than $4,000,000. It would be something to save this amount to the State, more especially as it has the greater part of it to be paid away in hard coin, the balance of trade against our Sugar importing countries being against us. It is, however, not reasonable to suppose that the public would give up entirely the consumption of foreign grown Sugars, and looking at the matter from this point of view, it would appear that the field for the production of Beet Sugar is rather limited; this, however, is a mistake, as the increase yearly of consumption, and the number of years elapsing before the Beet Sugar interest could assume such gigantic proportions, must be taken into account.

The Pacific Coast is now increasing in population annually at the rate of 85,000. California will have added by Dec. 31, fifty thousand to its population this year by immigration, and Oregon, Washington, Utah, Colorado, Idaho, Montana and Arizona 20,000. The natural increase will be 15,000, so that our figures are not beyond the mark. In ten years the increase from immigration, added to the natural increase, would have doubled the population of the Coast, and it would take ten years for the industry to grow so as to furnish the amount of Sugar that is now annually consumed. There need therefore be no fear among refiners of imported Sugar, that even a rapid increase in the production of Beet Sugar will interfere materially with their business.

One thing the Beet Sugar men will be able to do which the refiners of Cane Sugar have not yet succeeded in doing, and that is, to compete with Eastern refiners in their own market. We are informed by those practically acquainted with the cost of making Beet Sugar in California that it can be sold with a profit at 7½ cents per lb. Therefore, with freight at the rate say, of $30 per ton, the best Cube Sugars could be laid down in St Louis or Chicago at 9 cents per lb, that is, ½ cent per lb less than it is to-day sold at in New York. In this direction the field is practically illimitable, and it would be a quarter of a century before California could supply even a large proportion of the Sugar needed in the Central and Western Mississippi Valley.

With such inducements as these, it might be thought that the cultivation of Beet Sugar would attract considerable attention among our capitalists. And so it has, or, at least among the thinking portion of them, and we understand that preparations are on foot to establish several new Beet Sugar plantations and refinery works, and to import the necessary machinery and skilled labor. Let all interested in the business remember that the United States imports every year 1,600,000,000 lbs of Sugar, worth $77,000,000, and that the quantity and value is rapidly increasing. Let them remember that the Beet Sugar business is a paying one, and that twenty years ago California Wheat, Wine, and Wool were as little known as California Sugar is to-day. What changes twenty years more may bring about it is impossible to predict, but it is quite within the probabilities that California Sugar will then be as well known in the United States as California Wheat is in Great Britain.—*Journal of Commerce.*

CAR OSCILLATOR.—M. Giffard, of injector fame, has invented a method of fitting railway carriages which eliminates oscillation. The carriage is suspended by powerful springs at each end; and at the trials recently made in the presence of some members of the French Association for the Advancement of Science, the carriage was found to be so steady that reading and writing could be easily carried on. It will shortly be exhibited to the English public.

A Wheat Steam Fleet.

We learn that the Greek merchants of the Mediterranean are about to substitute steamers for sailing vessels in the transportation of Wheat from Southern Russia and from Trieste to England. This is a step long way in advance of us, but it is one which should learn a lesson to those interested. The Wheat trade from California to England will be this year much greater than that from the Black Sea to England; every year the disparity will increase and a steam fleet will become absolutely necessary to us.

The advantage would of course consist mainly in the economy of time. By way of Cape Horn the time taken by large steamers of 3,000 tons, would be about two months, or about one half of the time now spent in a voyage from San Francisco to Liverpool. By way of Panama, that is with steamers plying between San Francisco and Panama on the one hand, and between Aspinwall and Liverpool on the other, the time taken would not exceed a month. With way coaling stations for the Cape Horn steamers, and without that the Panama steamers could each readily carry 3,000 tons or 60,000 centals of Wheat each. That is, that making a trip a piece, the whole of the anticipated surplus of the year (14,000,000 centals) would be carried in 233 steamers. They would, however, make five round trips in two years by way of Cape Horn, and five in one year by way of Panama. By the former, 93 steamers would be required; by the latter, only 47.

The benefits derivable would be that the farmers and California commission merchants of San Francisco would be brought into quicker communication with the millers and consumers in Liverpool; that there would be less risk in losing on cargoes which cannot reach a market until four months had elapsed, and that in consequence a better price could be expected in this market. Especially by the Panama route would these benefits be derivable; as owing to the shortness of the time required to lay down a cargo in Liverpool, freights could be reduced to a minimum, and the change in the English market would not, under ordinary circumstances, differ more than five to ten cents from that prevailing when the Wheat was shipped. But at present, a shipper who buys in July, on the basis of $3.20 (present price in Liverpool), may be obliged to take $2.50 when the cargo arrives in Liverpool in November, thus losing on the money invested. On the contrary, should the Liverpool market rise, the producer in California loses in the same proportion.

The establishment of a steam fleet would render such a state of things impossible, and it would also demonstrate that California was likely to keep abreast in the general march of improvement with its neighbors on the coast of the Pacific. The South American Republics have long since been brought into steam communication with England, and many large and powerful steamers ply between that country and her colonies in Australia. The Chinese and Japanese waters swarm with steamers that carry freight from one port to another cheaply enough to compete with the native craft. It is therefore an anomaly to find one of the richest, most progressive and most civilized communities on the Pacific so much behind its less civilized and less progressive neighbors as to be dependent entirely on clipper ships for the transportation of its greatest staple. And it is one which we hope will not be allowed to exist much longer.—*Jour. of Commerce.*

ROCKY POINT.—Work has been discontinned on the Rocky Point quartz mine for the winter and the superintendant, Mr. Pickett, has gone below. The tunnel was ron 160 feet when the ledge was reached. When work was stopped, eleven feet had been run in the ledge, and still the headwall had not been reached. Where the ledge was tapped above, it was twenty feet wide, and the probabilities are that it is equally as wide in the lower tunnel. Every blast put into the ledge has been prospected, and not one failed to show gold in the horn. The ledge also carries a large body of sulphurets rich in gold. Machinery will be put up in the spring. A few days after the ledge was struck, Mr. Pickett received a letter from his company, in San Francisco, stating, in substance, that a reliable person and an old miner—one who was well acquainted with the lay of the land, had informed them that the tunnel was being run parallel with the ledge, and would not strike it till on or about the milleninm; and their advice was that he had better run a cross tunnel, if he wished to find any ore. Now, it seems to he in order to remark that these reliable old miners are often times reliable humbugs, and nothing more; and make more trouble than their infernal old carcasse are worth. As a rule they are ready to swear that a mine is not worth a cent unless they own an interest, and that all efforts to develop one are being prosecnted in an entirely wrong direction. They can just sling their eye along under ground, and tell exactly how the lead lies with the utmost ease and infallibility. They will say that rock is barren, at the same time they don't know the difference between molibdinum glance and a rip-saw. These men, in times past, have succeeded in getting capitalists to invest considerable money in mining enterprises that did not pay, very much to the prejudice of rich ledges and good miners.—*Mountain Messenger.*

Two new hoisting engines are now being made in thie city for the Savage mine. These engines are intended to be of sufficient power to work the mine to a depth of 4,500 feet.

THE Ahott Quicksilver Mining Company, of Colnsa, recently made their second clean-up, and took ont 27 tanks of quicksilver. Each tank contains 76½ pounds.

TEATS' PATENT FURNACE.

TEATS' PATENT FURNACE

For Roasting, Desulphurizing, Chloridizing and Oxidizing Ores, etc. For the reduction of Gold, Silver, Lead and other ores, saving a larger percentage, at less cost, than any other invention now in use. Chloridizing Silver ore more thoroughly, in less time, with less fuel, salt and labor; also roasting Lead ore preparatory to smelting, better and cheaper than any other invention. The Furnace is so constructed that one man, of ordinary ability, tends five or more furnaces; controls them with ease; adding heat or air; stopping or starting at will; charging and discharging with ease. Also, Patent "Conveying Cooler," for conveying and cooling roasted ores, heating the water for amalgamation and the boilers at the same time. Saving the large space in mill (covered with brick or iron), and the labor of two men per day, exposed to the poisonous chlorine gases. Also, Patent Air Blast "Dry Kiln," for drying ores direct from the mine or breaker, saving fuel and labor heretofore necessary in drying ores for dry pulverizing. For description refer to MINING AND SCIENTIFIC PRESS, No. 18, October 31, 1874. For particulars address

TREADWELL & CO., San Francisco.

DEWEY & CO.,
American & Foreign Patent Agents,

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of good patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1,
For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2,
For medium and seamy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.

Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

☞ The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,
v22-3m16p General Agents, No. 210 Front Street.

BY THE
MASS. CHARITABLE MECHANICS' ASSOCIATION,
at their Fair in Boston, in competition with the
Baxter, New York Safety Steam Power and the Sharpley Engines.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

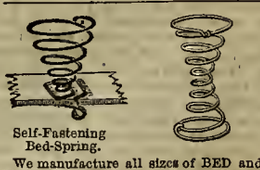
[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering two or four sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, baryta and quartz; and pyrites from quartz.

Added to a battery of stamps these machines constitute a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 15 or 20 tons per 24 hours.

For particulars apply to,

F. CAZIN, M. & C. E.
Supt. Denver Concentration and Smelting Co.,
At Denver, Colorado, Lock-Box 2225, or corner of Blake and 32d streets. ag3-16p



Self-Fastening Bed-Spring. Double-Spiral Bed-Spring.

We manufacture all sizes of BED and FURNITURE SPRINGS, from No. 7 to the smallest Pillow Spring; also, the Double Spiral Spring, which is the most durable Bed Spring in use. It is adapted to upholstered or skeleton beds. We have the sole right in this State to make the celebrated Obermann Self-Fastening Bed Spring. Any man can make his own spring bed with them. They are particularly adapted to Farmers' and Miners' use. Send for Circulars and Price List to

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, DECEMBER 5, 1874.

VOLUME XXIX Number 23.

Emerson's Diamond Stone-Sawing Machine.

The nse of the blsck diamond for rock-drills, as first invented in France, ten years ago, then in ordinary reciprocating stone-saws by Young, then for belt-saws by Cottrell, (using 450 diamonds), has nnw been succeeded hy its applicstion to circulsr-ssws for sawing stone; and our engraving gives a fnll illustration of this novel use of diamonds, being made after a photograph of the machine, as it appears when ready to operste. The saw is 73 inches in diameter, and csrries either 48 diamonds, or as many steel points. A peculiar arrangement allows the speed to be vsried from 5 to 500 revolutions per minute, with ths same velocity of the msin shaft.

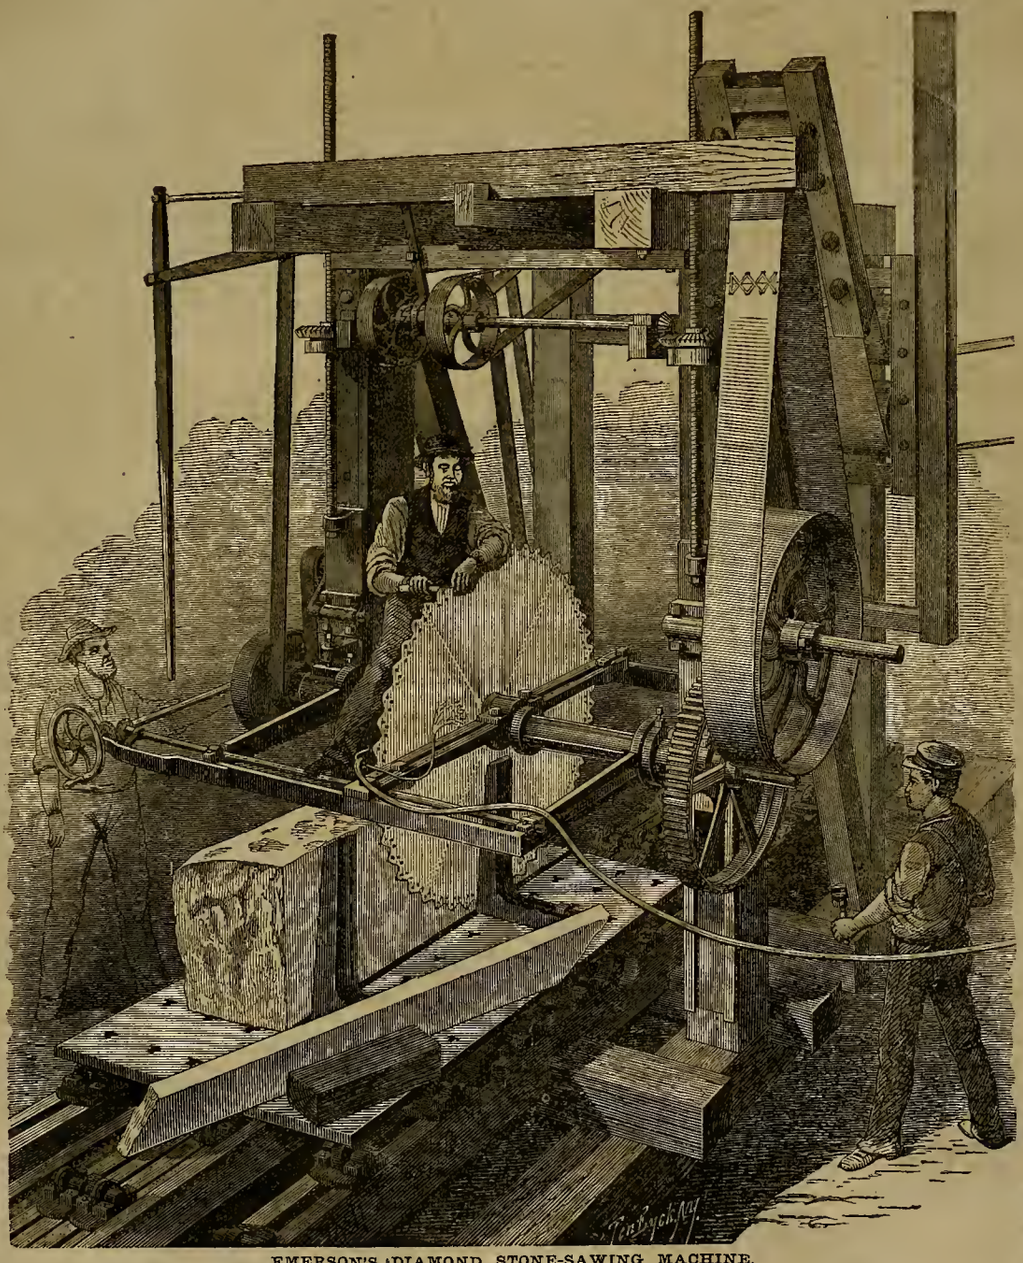
The feeding of the stone may also bs varied from 1-16 to 4 inches for every revolution of the saw, while the carrisge on which the stone lies, msy also be moved by hand, by a separate feed motion, back and fonrth, by mesns of a single hand-lever. Another hand-lever may raise the ssw while in motion, so thst when a stone is more thsn 30 inches thick, the saw may make a cut 30 inches deep on top, then run under the stone and make a cut from below npward. Ordinsrily tho stone is not moved when once placed cn the bed, hut sfter every cut, the ssw is moved sideways to an amount according to the required thickness of the slabs.

This machine fulfills a want which for a long time has existed, as skilled mechanics snd inventors have for yesrs been employed on devicos for a spoedy and cheap method of sawing stone in forms suitable tor building purposes. The stesm "ssnd-saw" wss thus far the general method in use, but it made elow progress — about 7 inches per day, in the ordinary sized blocks of marble; while the machine here described, in regard to rapidity, is equivalent to more than 100 ssnd-saws, even if driven by stesm. It has executed 125 superfioisl feet of actual cutting in one hour, snd this of the hardest kind of sandstone, requiiing diamonds as cutting points.

The capacity of the machine here represented, and which weighs 12 tons, is to ssw any length of stone np to 14 feet, and of a depth to 5 feet, so thst corner pieces may be sawn out. The diamond points are used for granite and hard grades of stone, while for soft sandstone of the ordinary grindstone, the hardened steel points sre found sufficient. That the work must be perfectly trnc, follows from the consfnction of the bed and accessories.

The manner of properly fixing the diamonds, or steel points in the saw teeth, was a matter of ingenuity, study and experience. The way it is accomplished ie shown in fig. 2. (page 361) showing two of the adjustable teeth; A is for diamonds, B. for steel points, and they are interchangeable, so that the same saw msy be armed with steel or with diamonds, as required. C, fig. 3, is the diamond holder and diamond detached from the saw, as seen sideways, and helow it as it appears when seen on edge; E is the diamond partly enclosed in its copper casing, and D. is the half section of C, showing the eavity which is to receive the diamond. The whole secret of setting is in the copper casing, which mnst envelop every jagged shspe and irregularity, and all surplns of the oopper mnst be cut off, then it is pressed into the cavity of the holder, which keeps it the same as in a jsw, and is still further closed hy being brought between the vise-like attachments of the saw's circumference, as seen in fig. 2. Figure 4 is a holder with three or more diamonds set in one piece, designed more particularly for straight saws, to he used with reciprocative motion

The diamonds used ars either the carbon or black diamond, or the "bort," an inferior stone, not used as a jewel. They are of an irregular form, as nature left them, presenting sharp, rugged corners and jagged forms, but are set uniformly, so as to give a small clearance for the saw, but not hslf that required in sawing wood, there being no fihre in stone Their corners mnst project exactly alike, so that they follow each other in their course, and leave a perfectly smooth surface. The circular saw which Mr. Emereon hss put up at Beaver Falls, Pa., is 73 inches in diameter, and holds 48 diamonds, the diamonds averaging about two carats, and costing from $15 to $18 each.



EMERSON'S DIAMOND STONE-SAWING MACHINE.

It is in the ordinary huilding-stone that the quick work of the ssw is most noticeable. A variety of stone was gathered at the mill, for experimenting. There was St. Genevieve stone, of which large quantities are used in St. Louis and Chicago; Berea, a hard, gritty stone from Ohio; elate; a coarse and hard stone from the water-works' quarries of Pittsburg, Pa.; snd also what is known as the Serpentine stone from Choster conuty, Pa.; a handsome and valuable variety which has come into extensive use, owiug to the difficnlty in dressing it. Through these stones, the Emerson diamond saw works its way much as a circular saw goes through hard wood. Of the ordinary building stone, it cut 2¼ feet a minute, or 306 superficial inches, at 100 revolutions per minute. The most striking illustration of the work of the saw wss on a block of conglomerate, imbedded with quartz, rock cryetsl, flint and agste, some of which were hard enough to cut glass. This was sent on from one of the Colorado mines, to see whst conld be done with it, as the stone is used out there for the same purpose as fire-brick. The ssw cut through the block—qusrtz, flint and crystal, with facility — leaving a smooth surface. This will bring this stone into value for the purpose indicated, in the construction of furnaces, etc.

In sawing through a block of the Berea stone, one of the diamonds was made to protrude a little out of line, and the result wss a beautiful and uniformly corrugated surfsce. This at once indicated the possibilities of the saw in turning out ornamentsl stone work. The surface of other blocks was somewhst similar in their lines to thst of twilled oloth.

Stone may be sawn to any length up to 14 feet, and of any angle or depth up to 5 feet, so that a corner piece may be sswn out of a stone block. All stone to the hardness of ordinsry grindstone may be sawn with hsrdened steel or metal points. Dismonds are snbstituted in working up the harder grades. The steel holders sre made sdjustsble and interchangeable in the saw, so tbat either the steel tooth holders or diamond holders msy be used in the ssme blsde. This machine received s gold medal at the late Cincinnsti Industrisl Exposition, where it attracted a great desl of sttention. The rapidity of its performsnce at the Exposition may be judged from a single specimen, when it sawed from a block of Alsbama fossiliferous msrble a slab 6 feet by 30 inches in 22 minutes. There seems to be no doubt thst it will cut, easily and satisfsctorily more thsn 1,000 superficial feet per day; snd such a fsct means a most thorough and sbrupt revolution in the stone bueines. And it does not get out of repsir easily. Running more or less nearly every day of the entire Exposition, it did not cost one dollar to keep it in order, neither lost nor broke is dismond, and we are told a in as good condition to-day as when first set up. What ponderous machine, newly invented and plsced in operation for tbe first time, (this is the first and only one of the kind ever hnilt), can, after a thirty days' rnn, show so desirsble a record? Parties desiring further inuformation concerning this mschine can address Emerson, Ford & Co., Beaver Falls, Pa., or R. S. Robertson, No. 12 Smithfield street, Pittsburg, Pa.

THE Baltic Mill, at Ophir City, Utah, is now running, the new battery and water wheel working well. The battery—five stamps—was made in Chicago.

THE new spur wheel for the works of the Justice mining company weighs 26,400 pounds. This is the largest wheel ever brooght to the State of Nevada.

Traps for Sewers and Water-Closets.

The importance of trapping the communication between sewers, cess-pools and in-door water-closets, basins, etc., is generally appreciated, but information concerning the construction of traps, the circumstances which render them ineffactual, and the expedients, temporary or remedial, by which noxious gas may be shu ont of dwellings, should have more publicity.

An elnborntion of the subject would require an illustrated treatise, but I will crowd asmuch as I can within a moderate compass, regardless of ronnded periode.

Different Kinds of Traps.

We have box-traps, bell-traps, globe-traps, p-traps, s-traps, how-traps, basin-traps, and a oombination of the last named with others. Some are made of wood, some of masonry or earthenware, some of porcelain, some of iron, some of brass, some of lead, nnd some of tinned iron or copper. Their names are suggestive of their several forms. My remarks will refer chiefly to those ordinarily used in dwellngs.

The Depth of a Trap.

Theoretically, the efficiency of a trap depends upon its depth; that is, the vertical distance between the surface of the water it will contain (in a state of rest,) and the "drop" or "dip" of the trap. Tecbnically, the water which is designed to shut out the noxious gas is called the "seal;" so, the depth of the trap, and the depth of the seal are convertible terms, and it is correct to say, "the deeper the trap the deeper and stronger the seal."

The Dangers.

There are sundry contingenciee to which even good traps are liable, if not guerded, each of which will admit noxious gas into the house.

First, the wnter forming the senl may evaporate; eecond, it may be siphoned; third, it may be eucked out; fourth, it may he blown out; or, fifth, it may be forced back by the preasnre of gas in tbe water-pipes. The first occurs when there is too little weter for the surface expcsed, or when the receptacle, above, remains long unused. Hence, *idle basins* are sometimes dangerous.

The seoond is of very common occnrrence, and results from the most inexcusably bad consiruction. The trap and waste are made to form an infallible siphon which will empty the deepest trap when the plug is withdrawn from a full basiu or tub.

The third and fourth are likewise due to had construction. Several basins, at different elevations, are made to discbarge inlo a waete system so defective that the weter from one sucks the trap of another, by creating a partial vecuum in the intermediate pipe. Or, if the main waste becomes "air-bound," which is not nncommon, a full pipe end a rnpid flow will compress the retnined air sufficiently to blow out the contents of one or more traps, and leave them comparatively empty. Again, when a street sewer is full of rapidly flowing water, traps in houses communicating with it, through a defective waste system, are liable to be sucked; and, even when the sewer is not full, if the wasts eyetem discharges beneath the surface of a rapid current, the liability is the same. After the current subsides, houees with open traps sre liable to receive the benefit of the noxious gas from their own wnstes, at least. Hill-side residents should remember thie.

The fifth contingency referred to is, perhnps, the most dangerous, for it frequently remains undiscovered until after the funeral. The pressure of gas which forces back the wster in n trap comes from well known sources, yet I will briefly enumerate them: First, pressure from accamnlation in nnventilated sewers, cess-pools, or "air-bound" house wastes; eecond, pressure from choked sewers and drains; third, pressure from hack-weter in sewers, or the filling of close cess-poole with water.

The pressure of the gas gently "backs" the water in the traps, just enough to allow the meseenger of denth to sneak eilently into your house, in the form of infinitesimal globnles, which noiselessly escape from their watery film, and mingle with the breath of your noetrils.

Coneidering our defective sewerage system, our numerous cess-pools, the contingencies nbove mentioned (which are by no meens small), and the fact that the eeal of the trap is the only barrier between the ges of sewers and cess-pools and our living and sleeping apnrtments, it is an alarming reflection that the grenter proportion of the treps in San Francisco(nnd I doubt not in many other citiee) are liable to the contingencies referred to.

Temporary Protection.

The only temporary expedient available as a protection against unreliable baein traps ie also applicable to those of bath-tubs. When empty, turn the faucet a little, and let the water run slowly until there is au assurance of a full trap. Then plug the outlet and cover the plug with water. Finally cover the overflow holes with several thicknesses of wet paper, or its equivalent. This expedient, which experience bas tnught to many, should be known to all.

It is almost impossible for a trap to be sucked with the air passages thue closed. Evaporation ia retarded, and so ia the ingress of gaa —provided the overflow escape ia made secnre.

The Remedy.

Tne only remediel expedient which ie worthy of triel ia that of leading one or more air-pipes from the waste system to the roof of the building. This is a device well known to intelligent architects, end to plumbere. Its adoption in the building of a house involvee only a trifling cost, and rendere every good trnp infalible; yet it ie not commonly noticed in architects' specifications, or in plumhers' work.

A ventilating shaft huilt in conjunction with a kitchen chimney, is a most valuable aid in relieving a wa-te syetem, and in default of that the chimney can thus be utilized.

The Way They Do It.

Remarkable to relate, wash-basin traps, as eupplied by plnmbere in San Frencisco, vary in depth from balf an inch to thres inches. By far the larger number in use are made by bending a section of lead pipe in the form of a horizontal S, or a horizontal loop. The caliber of the pipe is generally contracted in bending. By filling the pipe with sand, before hending it, the liahility of contracting the caliber is decrensed; hut even that is too much trouble, in cheap work, and the difficulty in avoiding the contraction is the incentive to make shallow trapa. Ae a rule a gentlemnn's stable is trapped more securely than hie bed-chamber.

I will not describe the severel kinds of traps made of cast-iron or brass, lest I should extend my remarks too far. The cast-iron traps imported from the East are nbout one inch deep. They are adopted by some plumhers and rejected by othere.

Reliable Basin Traps.

The most reliable indoor traps are of sheet lead, made of two pieces, hammered into form, matched and soldered. For wash-baein, kitchen and laundry traps, they should never he shallower than three inches. Plumhere disagree concerning the proper depth, but it is conceded that San Francisco requiree deeper traps than Now York.

Closet Traps.

Soil-pipes should be double trapped. Four inches is the approved caliber of the pipe and msin trap, and the depth of both traps should be one inch and a-half. No single-trap closet should he nllowed within a dwelling. What ie known as a "baein closet" is the best. A general description of one will suffice. Say the porcelain basin is encircled by an outside flange, about midwey of its depth. It is set partly into an iron bowl that has a flanged rim which fits the flange on the basin The two are festened together with some intermediate putty, so thet no gas can escape. The main trap is attached to the bottom of the iron bowl. The second, or auxiliary trap, ie the movable one formed of the metal hasin which ie in sight, and which is under command of the lever-rod. It traps the vent of the porcelain basin, and is a "basin-trap" in the donble sense. It may be termed an "inverted bell-trap." It works within the iron bowl, and thue the double trapping is accomplished. Tho apparatus which governs the basin trap is outside of the iron bowl; and, beiug complex, it shonld alwaye be accessible, and generally is. The raising of the lever-rod removes the metal baein, and flushes both basins and the iron bowl; and the same water flushes the mein trap.

The flushing ceases so gradually that it insures full trnpa, even if a mass of paper, etc., escaping from the main trnp, causes a momentary euction; nor is the supply of water efficient to siphon it.

As a rule, a double-trap closet, if kept clean, ie lese dangerous than a wash-basin that communicates with the same sewer or cess-pool. The noxious gas from such closets emanates from the filth wbich is allowed to accumulate above the main trap. If the basin is cleaned daily, and tho iron bowl and the soil-pipe, as far down as the trap, are cle nsed twice n week, there will be no offensive smell. The best cleansing implement is a common hearth-broom, which ehould be kept for the purpose. Nevertheless, it is a wise precaution to rnn an air-pipe from every soil-pipe. The bnth-waste should not enter a soil-pipe. The alternate expansion and contraction caused by the use of a large amouut of hot wnter at one time, fol lowed by a sudden rush of cold water, is particularly injurions, in San Francisco experience.

Trapping the Drain.

Where a waete system concentrates into one drain-pipe, it is well to trap the drain before connecting it with the sewer, remembering always that two lrnps on the same pipe or drain will not opernte without an air-pipe.

It ie to he hoped that my remarks will contribute toward popularizing the fact that there is no economy in cbenp plumbing, if the cost of repaire, doctora' bille and fnneral expenses are considered. In conclusion, I will add that much cheap plumbing is attributnble to the paraimony or ignorance of those who build houses "For Rent;" much is due to competition among architects and contractore, and the failure of nrchitects to drnw specifications clearly and fully; and much to the tricks of dishonest plumbera, who rely upon their ability to cbeat nine-tenths of the architects and 99 hundredths of the owners.—*Pacific Medical and Surgical Journal.*

THE mill at Reno will herafter charge $35 per ton for redncing silver ores, allowing in hullion eighty per cent. on ores, the assay value of which ia $400 per ton or loss.

The Boston and Colorado Smelting Works.

A correepondent of the Colorado *Democrat* says: The Boston and Colorado smelting company handle more ore and ehip more bullion than any other establishment in Colorado. The older and main worke, containing three furnacee, are at Black Hawk, while the newer ones, conteining two furnaces, are located at Alma, in Park county. The process is that of Swansea, Walea, and such close and reliable results are obtained, that all of the high grede ores that can he treated are constantly received from all parte of the Territory, over half a million dollars' worth of ore being carried on hand throughout the year. We are informed by the head of the company, Prof. N. P. Hill, that the product of both worke would aggregate $2,000,000 for the year 1874. Of this amount about $500,000 ie obtained from the gold minee of Gilpin county, being from the high grade ores not treated by the stamp mill process. The remaining million and a half is mainly from the silver mines of Clear Creek county, and from Mount Lincoln and Caribou districts. The latter furnishes over $20,000 per month to the Bleck Hawk works, while Mr. Church, the company's agent, paid out $80,000 in September, in Georgetown, for silver oree for the same institution. From February 6th to October 31st the purchases at Georgetown amounted to $312,033.95, but would hnve been much larger but for the injunction on the great Dives end Pelican mines. From September 22d to October 10th, $129,000 worth of silver bricke were sent East, one shipment amounting to $75,000. Previous to October, 1873, the precious metals were shipped to Swansea, Walee, in the form of matte, where the gold, eilver and copper were extracted, but the eilver is now turned out at Black Hnwk, both for these works and those at Alma, in the shape of beautiful bricks 999 fine, while the gold is sent to Boston in alloy for parting.

Dnring the past year twenty-four tons of silver bricks (29,966 ozs.) were produced. The Black Hawk works hendle twenty-nine tons of quartz and thirty-five cords of wood daily, giving employment to seventy men, who are paid from $3 to $6 per dny, while an equal number are engaged in cutting and hauling wood for fuel purposes. Duriog the next week about 400 tons of copper will be shipped. These works are mnnaged and conducted hy thoroughly competent men, and hnve proved eminently successful, but the process is too expensive to smelt the lower grade ores.

DEEP SEA SOUNDINGS.—The U. S. steamship "Narraganset" hns been making an experimental cruise outside the Golden Gate, in deep sea soundings. The sounding apparatus is of the Thompson pattern, but of heavier metal, and the specimen cups are known as the Belknap Cylinder, the invention of Commander Belknap, of the United States Navy. The heavy shot, weighing 58 pounds, specimen cup and Cassill's thermometer, were attached to 25 fathoms of Albecore line, and lowered into the water until the strain came upon the wire, when they were let go to the bottom of the ocean, which was reached at a depth of 2,199 fathoms in 26 minutes and 41 seconds. The drum containing the wire was then connected with a large balance wheel hy means of an endless bend, and this great length of line was recovered in 33 minutes and 24 seconds. The temperature of the bottom, registered by the thermometer, was 34 degrees, which agree with the results of previous experiments. A quantity of green matter was brought up, which, when put under the microscope, was found to be composed of diatomacea and their debris. The experiment was attended by highly satisfactory results, and at one P. M. another cast was taken at a point twelve miles nearer the South Farallon light-house, in 1,993 fathoms, with satisfactory results.

A $500,000 SUIT IN NEVADA.—A very important lawsuit, involving the title to mining ground worth over a half million of dollars, is at present being tried in the District Court. It is entitled Sol Weil vs. the Lucerne Mining Company and the Silver Hill Mining Company. The action is brought to recover possession of "all that portion of mining ground and quartz lode commencing at the south boundary of the Justice claim, and running thence southeasterly upon and embracing said lode a distance of 927 feet, and lying wholly in Gold Hill mining district." In other words, the suit ie for the whole of the Silver Hill mine, which comprises nearly a thousand feet of ground, extending south from the line of the Justice mine. Weil's claim is based on a location made in 1859. The Lucerne company applied for a United States patent for the ground in 1872, which application Weil resisted, and brought the present suit. The Lucerne company subsequently sold their interest to the Silver Hill company, but are joined with them as defendants. The trial is before a jury, and the case will probably not be finished for a week, as it is progressing slowly, and a large number of witnesses are to be examined. Stone, Lewis and Deal are attorneye for the plaintiff, and Meeick, Seely & Wood for defendants.— *Virginia Chronicle.*

A CORRESPONDENT at Tybo says: Mines of carbonate ore have been discovered in Rattlesnake canon. They are not yet fully developed, but at present open a fine field to the prospector. A considerable amount of bullion has been shipped lately, and a large amount ie still on hand awaiting transportation.

Gilpin County, Colorado.

A correspondent of the Colorado *Democrat*, writing from Central says: The bullion product of this, the leading gold region of Colorado, has been steadily increasing during the past three months and the gold shipments of the year will considerably exceed those of 1873, which were less than usual. During the nine months ending October 1st, $793,800 worth of mill gold was shipped East through the Central express office; the B. & C. smelting works sent forward during the same time about $375,000. These figuree are as nearly accurate as can be obtained at the present time and foot up for nine months a total of $1,163,000, or at the rate of $1,461.000 for the year. But as the last quarter's shipments will, from present indications, fer exceed thet of any previous one, we can eefely put down the gold shipments of Gilpin at over $1,500,000 for 1874, outside of a considerable amount of the precions metal that remains here or finds an outlet through other channels. The eilver shipments which pass through this county or are sent East from the smelting works do not enter into the above figures.

Nineteen stamp mills with 518 stamps are now running in Gilpin county and quartz ie much more plentiful than during the past summer, causing several idle mills to he set in operation. The new dressing works of Collom & Co., at Black Hawk, erected for the purpose of concentreting low grade ores and thus rendering them marketable and profitable, are shut down for the present, hut, the owners assert will be going again as soon as smelting works can be erected.

Many mines that have been idle for months or years are again resounding with the drill, pick and shovel, and are often proving quite remunerative to the owners or lessees. While no such massee of precious metal are met with just at present as have lately been found in the Sherman, yet old Gilpin can show many minee that are yielding handsome profits to their operatore. Among them is the 900 feet of property of the Burroughs lode, of Quartz hill, leased by Roberts & Co. This mine previous to 1873 had remained idle and filled with water for years, but in little over a year ending with last June, $75,961.55 had been obtained from it, while the amount of gold now produced is double that of the year above mentioned. Probably the last half of 1874 the mine will yield over $75,000. The lessee began working out the levels and drifts, but, emboldened by their success, began siuking until they are now down 800 feet below surface, being the greatest depth attained in any mine in Colorado. At the bottom of the shaft, as well as in the various levels, is found the same width vein of ore, yielding from $40 to $50 per ton in the stamp mills, while the more valuable ie sold at the smelting works at $100 per ton and over. Thirty-five men are employed, and about the same number of tons of ore are raised every twenty-four hours. Thie is the same mine that the famous Pat Casey once made his "big raise" and sale on, in the days of '60 and '62, and of Casey's night hands, and its late history has proved that Colorado mines do not "play out" in deep workings, a fact that will encourage many a doubting and disconreged miner to push on through "cap" to the riches that lie stored beneath.

The old and reliable Gregory is again being worked extensively, and is generally maintaining its record as the grandest mine in the country. Something over 100 men are employed upon it, and the recent consolidation of the Briggs and Black Hawk interests encourage the hope that another season will see as many men at work there as in the prosperous times of days gone by. The Briggs property has been paying large dividends during the past year. The Leavitt mine is yielding as largely as ever, carrying a very wide crevice, and employing from 80 to 100 men. Thie lode shows what careful, economical management will effect in mining operations, for the owner.

Bela S. Buell has been enabled to reap a steady profit on a class of oree that were considered worthless but a few years ago. The sixty-stamp mill, immediately over the mine, was completed over a month ago, at an expense of over $100,000, being the most expensive and finest affair of the kind in Colorado, and is working most satisfactorily. From fifty to seventy tons of quertz are raised daily, being something over the capacity of the mill. Rock yielding but $7 per ton is here mined and milled, and made to yield a steady profit. Work has again been resumed on the Bates, Bates & Hunter, Sudeberg, Smith and other valuable lodes, while the Kansas and Gunnel are extensively worked in several places. The Kansas has yielded about $100,000 during the past year, and is still in pay.

RYE VALLEY MINES.—A Baker city letter to the Oregon *Statesman* says: "Rye Valley, in this county, is just now the exciting point among the people, rich strikes having lately been made. Green's discovery, at water level, actually assayed $10,000 to $35,000 silver to the ton. Complete and extensive reducing works are now in course of erection on this and other mines in the district, which will all be in working order in the spring. Workmen will be engaged underground all winter in getting out ore from the Green discovery mine. Many new and interesting discoveries are being made daily, prospectors being out in large numbers. A mountain of gypsum has lately been found which, after being tested by competent hands, is pronounced equal to the best imported plaster of Paris."

MECHANICAL PROGRESS.

The Proposed Substitute for Steam.

The interesting announcement of a substitute for steam as a motive-power has been recently made in Germany from a source entitled to a hearing. The rapid consumption of the earth's fuel supply and the drain on its forests, attended by so many disastrous consequences, have stimulated scientific inventors to find a successor for steam, and it is to be hoped the present discovery will prove a success. The new motor is carbolenm, and its application to machinery is claimed for Dr. Beins, of Groningen, who has devoted many years to its study and utilization. Experiment first taught him that when the bicarbonate of sodium is heated in a closed space, at a temperature of eight hundred degrees Fahrenheit, liquid carbonic acid is distilled out of it, having the expansive force of fifty or sixty atmospheres. Carboleum is not dangerous as an explosive, and the fact that, thus employed as the German inventor proposes, it is possessed of enormous motive power, was attested by scientific men to whom the experiments were shown. The heat required to bring out this motive power of the carbonic acid in the new caiboloum engine is apparently very small when compared with that requisite for producing a high pressure of steam in the ordinary engine. In the former it is only three pounds of coal per hour for each horse-power represented by the engine—an amount so small that it would be unnecessary in ships driven by the new process do devote much space for fuel. The chief value of the invention, however, is claimed to be its practicability in large factories. The author thinks that for the great industries the carbolenm engine can, in nearly every instance, take the place of steam.

The scientific value of this discovery is immense, if mechanical ingenuity can successfully apply it in the direction indicated by Dr. Beins. If it is said that the supply of carboleum is not as plentiful as that element from which steam is made, it may be answered it is almost as large as that of coal in some parts of the world. Carbolenm is found inexhaustible in beds of common chalk in all parts of the earth. As common chalk contains carbonic acid to the amount of half its weight it will yield double its volume of carboleum. And the chalk resources of the earth are vast beyond computation. The cretaceous rocks cover a large extent of subterranean Europe and Eastern Asia, and abound in North and South America. The chalk beds which cross under the English Channel at Dover have been gauged at five hundred feet thickness, and similar beds have been found in France, Germany and Denmark, while the soundings of the ocean bottom show that they probably exist in a growing state in many geological districts. In the United States few formations are more widely distributed than the chalk, varying in thickness (according to some authorities) from four hundred feet along the Atlantic seaboard to two thousand five hundred feet in the Upper Missouri valley.

It is evident, therefore, that the proposed successor of steam, if mechanically applied, would be used over the larger part of the world as an invaluable auxiliary of steam, with an enormous economy of wood and coal. The successful introduction of such a motive power, minimizing the fuel consumption, would be a boon of incalculable importance in the manufactures and arts. That the principle upon which its introduction is claimed to be feasible is scientifically correct seems hardly to be doubted. If the immeasurable chalk beds are stored with mechanical energy, as we know the coal beds are, the anxiety of physicists and economists, lest the world's fuel supply may fall short in the lapse of a few centuries, is dissipated. The utilization of the new fuel would give an impetus to all industries, and might revolutionize the commerce of manufacturing nations whose wealth and political power are mainly due to their coal supplies.—*N. Y. Herald.*

Soldering Broken Files.—A writer in the *English Mechanic*, who had broken the only half-round file he had by him, says: "After trying to use the broken end (it was broken about the middle) I was about to give up in despair, when I thought I would try soldering; and, to my surprise, it not only stood while I completed the small job I was then doing, but is in use still, and will stand all the force such a file needs to have applied to it in ordinary use. I used ordinary solder, Baker's solderiug fluid, and a Bunsen burner. The temper at the joining is not in the slightest altered. Of course I was careful not to heat it more than requisite to melt the solder."

Elastic Glass.—Patents have been taken out in several European countries, by M. Bastie, a Frenchman, for elastic glass, which we are told is to supersede much of the crockery and metal used for kitchen utensils and table-ware. A tumbler made of it is not broken by falling ten feet on a hard floor. The introduction of a new material that has come into general use for most articles of table-ware has been a rare event in history, and we shall follow with interest the fortunes of Bastie's discovery. A change in such matter implies economy and convenience.

Utilizing Wave Motion.

The *Melbourne Argus* says: "Regarding Mr. R. S. Deverell's experiments with ocean-wave power machinery, Mr. Ellery, in his address at the Royal Society's meeting, gave the following information: Some months ago Mr. Deverell devised an apparatus by which the movements of a ship at sea could be registered. This was placed in charge of his brother, who went to England in the ship "Norfolk" for the purpose of making observations with it on the voyage. From the results of these, Mr. Deverell deduced the following:—'The duration of the voyage was 2,026 hours. During that time the ship made 1,764,088 beam oscillations or rolls, and 1,011,137 fore and aft oscillations or pitches. The average number of oscillations in both directions per minute was 14. The aggregate arc of pendulum registering beam movements was over 15 million degrees, while that of the fore and aft movements was nearly 5 million degrees.' Mr. Deverell also considered he had definitely established from these observations the following propositions: 1. That between ocean limits the swell of the ocean is unceasing. 2. That the oscillation of a vessel in an ocean fetch is unceasing. 3. That the motion of an independent body within a ship on the ocean is unceasing. Here then was represented an immense amount of conservable energy, and the question remained, 'Could a practicable method be found for conserving it for use on board ship?' Mr. Deverell believed it could, and to a sufficient extent to be useful in auxiliary propulsion. Mr. Deverell expected to be in a position in a few months to detail his method of putting his propositions into practice, and promised to bring it before the Royal Society of Victoria as soon as it was matured. Mr. Ellery mentioned that Mr. Bessemer had purchased from Mr. Deverell the instrument the "Norfolk" voyage observations were made with, for his famous saloon ship. This fact had probably led to a report which appeared in print some time ago that Mr. Bessemer and the Admiralty were building ships on Mr. Deverell's principle, but which was entirely without foundation.

Carbonized Brass.—For the last eighteen months Mr. B. W. Baldwin, of Philadelphia, has been manufacturing an article which he calls "Carbon Bronze," or Carbonized Brass. This article has been in use by several prominent firms here, and has received a fair test in rolling mills and on railroads, for car machinery and other purposes where great durability is required of anti-friction metal. After 25 years of experience in the manipulation of copper and its alloys, with the assistance of Prof. Weisman (metallurgist, late of Franklin Institute), the inventor succeeded, nearly two years ago, in establishing the theory of its mixture, and perfected and brought it into practical use. In casting it resembles gun metal, but its fiber is more compact and close, giving it great elastic resistance under heavy and repeated strains. In finishing, it receives a high degree of polish. It is perfectly homogeneous, and under a tool cuts easily and smoothly. There are two other advantages which this metal possesses, one is that if it is cast in fine sand it is ready to go upon the bearings without being reamed or otherwise finished; another is that it will not cut the necks of rolls, car axles or journals. It casts remarkably sound, and when confined, as in a "sousing," it will wear to a fine shaving, no lining with Babbitt metal being required. Messrs. Hutchinson & Co. are testing it in pump linings, as to its merits of resisting the action of sulphur water. The cost of this metal is about 15 per cent. less than gun metal.

Substitute Wanted for Mica for Stove Lights.—Mr. J. A. Price, of the Scranton (Pa.) Stove Works, writes to the *Iron Age* as follows:

Since the illuminating principle in stoves has become so thoroughly established, and the consequent demand for mica has become so disproportionate to the supply, is it not possible for some of our chemists to produce some chemical substitute for the same that shall be cheaper and as durable? Illuminating stoves to the household are like pictures on the walls, refining and civilizing in their influence and tendency, and as great a boon to mankind should not be jeopardized by fear of any failure of the supply in an article that possesses the quality of so much pleasure and health-giving comfort. Should this suggestion be within the possibilities of chemical combinations, a liberal reward would be paid by the stove manufacturers of the country.

Illuminating stoves are most desirable and should become more general; but we think that in view of the important discoveries of that mineral now being made in this State, the trade may soon be supplied with almost illimitable quantities.

Petroleum for Alcohol.—M. Masson, a Lyons chemist, struck by the saving which might be effected by the substitution of purified petroleum for alcohol, in a great many preparations, set himself to work to make experiments and now announces that he has discovered a simple and economical means of purifying, disinfecting and deodorizing mineral oils; and that a saving of 70 per cent. may be made by substituting this sort of petroleum for alcohol in chemical preparations.

SCIENTIFIC PROGRESS.

Steel Direct from the Ore.

The system of Ponsard, for producing steel direct from iron ore, has attracted much attention, and *La Metallurgie* gives the following account of an experiment made on this system:

For several years metallurgists have essayed to treat iron ores in a reverberatory furnace, instead of the blast furnace, which, besides being very costly, can only, as yet, be worked with coke or charcoal, of which the cost has largely increased of late years. All the attempts made in Europe and America have heretofore been unsatisfactory, but the problem has at last been solved.

On the 27th of September, at the forge of the Veriores, at Vienne, France, the first production of pig iron by the direct treatment of the ore in the gas reverberatory furnace system of Ponsard, took place under the superintendence of the inventor, with the assistance of M. S. Perisse, director of the General Metallurgical Society of Paris.

The apparatus consists principally of a gazogene, which transforms the fuel in a series of large chambers, and of an apparatus in brick, called the recuperator of heat, which receives the flames from the furnace, and restores the caloric in the form of hot air. The compartments of the chamber serve successively for the reduction of the ore, for the reactions which are effected, and, finally, for the fusion of the whole charge in such a manner that the separation of the component parts is effected by the difference of density. These various phases of the operation require very different temperatures, and the production of these is the special object of the apparatus. On the side of the furnace doors the temperature is only that of red heat, while beyond the heat is so great that the eye is unable to support the intensity of the glow. This extraordinary heat is estimated at 2,000° Cent.

The success of the experiment is reported to have surpassed all expectation, and the result obtained is considered to demonstrate the possibility of producing steel direct from the ore without any of the transformation necessary under existing systems. Of course this is a fresh revolution in the history of metallurgical industry; and it is almost unnecessary to add that, should the system justify the report, it will prove a revolution indeed.

The Divisibility of Matter.

So far as our senses, aided by the most powerful microscopes, are able to discern, matter is infinitely divisible. Chemical experiments seem to prove that there is a limit beyond which we cannot go. Let us take a particle of chloride of silver, and subdivide it until we reach that limit, and the infinitely small particle of chloride of silver which remains to us is called a molecule. Let us divide the molecule and we have no longer a particle of chloride of silver. A molecule is so small that it cannot be divided without breaking it up into its constituents. When water is heated and converted into steam, the particles of water become so small that they are invisible; as the heat increases the particles of water break up into smaller ones, until finally the molecule is reached; then increase the heat still more, and the molecules break up into atoms of hydrogen and oxygen. To this particular phenomenon the name of dissociation is applied. Assuming, then, that all matter consists of atoms united in the form of molecules, which may be simple or complex, we have one system on which to base our system of notation. These atoms being invisible, as the word implies, must have certain definite weight, which weight has been relatively ascertained by careful experiments. Ampere has satisfactorily established the following law: that equal volumes of all gaseous state contain the same number of molecules. Hence it follows that the molecules of all bodies, when in the gaseous state, are of the same size. This makes it a very easy matter to ascertain the weight of a molecule of any given substance, if that substance be a gas or convertible into gas. Oxygen is sixteen times as heavy as hydrogen; hence if we call the molecular weight of hydrogen two, the molecular weight of oxygen must be thirty-two. Having learned the molecular weight of any simple substance, by finding its specific gravity as referred to hydrogen, we only need to divide that by its atmospheric weight to find how many atoms there are in the molecule of that substance. The atomic weight of oxygen is sixteen; its molecular weight is thirty-two, hence there are two atoms in its molecule. With a very few exceptions, the molecules of all simple substances, contain two atoms each. The molecule of a compound body may contain one or more atoms of several different substances, but it always remains of the same size, even if it contains fifty atoms.

More Air to Science.—A gentleman of Milan, named Ponti, left his property, amounting to $165,000, to the three Academies of Science in London, Vienna, and Paris, and to the General Hospital in Vienna, the last-named institution being also entitled to any increase beyond the original sum; and the value of the property being now estimated at $360,000, the hospital is likely to receive a large share.

Lord Shaftesbury on Scientific Inquiry.

In a recent address the Earl of Shaftesbury says: If he had the wealth of Glasgow, or the wealth of a few people in it, so far from fearing the progress of science, as many people did, he would spend no end of money to encourage it. He would urge upon these masters of wisdom that they did not plunge deep enough; they should go further and wider and higher. He wished a thousand times as many minds were engaged in scientific pursuits. A few eminent men held a monopoly, and they crushed the public with their crude and abundant fancies. But there was no greater folly than that committed by those who would maintain revealed truth by counter theories. The Bible has suffered far more from its friends than from its enemies. In their timidity they have deprecated inquiry, and so have appeared to distrust their own Zion. In their over zeal—as if the Bible could not take care of herself—they have proceeded to give explanations and interpretations which the language of Scripture would never justify, and then some clever scientific man laid hold of it, and in his criticisms has overthrown the faith of many by his just and his ridiculing observations. Had he the wealth of Glasgow he would say to Max Muller and his Orientalists: "Here is the sum of £50,000; collect the facts you require. Send abroad your men. You say languages are dying out; send abroad and take the dying speech, the last confession of these dying tongues." He would send the same sum to Professor Tyndall and say to him: "Accumulate the facts; I don't care about your theories, but turn your powerful intellect to the pursuit of facts." He firmly believed that if Glasgow or any wealthy city were to come down with such a means of advancing science they would see that in less than 10 years that grand old book would be like the ark upon the top of Mount Ararat, surveying the subsiding of the waters and rejoicing in the restoration of life and joy.

The Use of Tin Vessels.—In a paper addressed to the French Academy of Sciences, Dr. Fordos gives the results of some experiments of his on tin vessels used in laboratories and hospitals, and even in private families, for infusions and similar purposes. These utensils generally contain lead in certain proportions, and it was, therefore, not inexpedient to learn how far that poisonous metal might be injurious to health in the long run. Dr. Fordos began by introducing water acidulated with one per cent. of acetic acid into a tin jug provided with a lid. After letting it stand for a few days he observed on the inner surface of the vessel a slight white deposit, which was soluble in the acidulated water, and communicated to it all the characteristics of a lead solution; iodide of potassium yielding a yellow precipitate, sulphuric acid a white one, and sulphuretted hydrogen a black one. Nevertheless, the latter test is not reliable, since it causes a black precipitate with a salt of tin likewise dissolved in the liquid. The existence of a salt of lead in the white deposit is, however, sufficiently proved. It is confirmed in another way; if the inner sides of the vessel be rubbed with a piece of clean wet paper a solution of iodide of potassium will turn it yellow. In certain experiments a crystallized salt of lead was detected at the bottom of the jug. In other series of experiments wine and vinegar were tried; they both became charged with lead, as they dissolved the lead salt deposited on the sides. Again, tartaric lemonade, left for twenty-four hours in the vessels, became impregnated with lead. Hence Dr. Fordos concludes that in alloys of tin and lead both metals are attacked, the latter being generally the first, when in contact with the atmosphere and acid liquids, such as wine, vinegar, lemonade, etc., and that consequently there may be serious danger in using such alloys, either in the shape of vessels or in tinning culinary utensils.

A New Form of Electro-Magnet.—A contributor to the *English Mechanic* thus describes an electro-magnet, constructed upon a novel plan and possessing a power far greater than those of the ordinary type:

"First, I took a number of pieces of iron wire, 16-guage and 12 in. long, and, commencing half an inch from the end, I wound fine silk covered wire (as used for the secondary in coils), for 2½ in. down, then gave two or three long turns, carrying the wire to within three in. of the other end, and wound that in the same manner as the first, and leaving long ends of the fine wire for subsequent attachment. The covered wire was then dipped in a spirit varnish and put aside to dry. When I had covered a number of these I bent them up into the form of a horse-shoe magnet, and put around them a number of pieces of similar wire, but uncovered, so that I had a horse-shoe magnet much resembling the bundle of wire in the core of a 'coil.' The whole lot was then wound with eight coils of 16-guage covered wire in the usual manner, and all the ends of the fine wires soldered to the outside copper wire. The result quite surprised me, and no doubt will be of some use to those who do not mind a little trouble for the sake of a superior article."

M. Hannecker uses for the oxhydrogen light (and obtains increased brilliance) a cylinder composed of carbonate of lime, magnesia, and olivine, compressed by hydraulic pressure. The olivine used is a natural silicate of magnesia.

Mining Stocks.

The Stock Market during the week under review has been unusually buoyant. Prices of several stocks have in the last few days touched the highest figures for a year. The chief excitement has been in the Con. Virginis group, including that mine, California, Ophir and Union Consolidated. There has been considerable movement in the Gold Hill stocks, consisting of the Yellow Jacket, Empire Mill, Imperial, Confidence, etc. Reports of extensive strikes in the American Flat mines will doubtless favorably affect stocks of that locality. It will be remembered that we predicted some weeks ago, when the market was thought to have already reached its best, that the highest prices were yet to come.

California, Nevada, Pioche and Idaho stocks are comparatively neglected.

The Rye patch mine, which declared its first dividend this month is situated in Rye Patch, Nevada. The dividend is equal to 50 cents per share, or $15,000. The Rye Patch Mining Company are working twenty men in the mine, and taking out sufficient ore to run their ten-stamp mill night and day. They ship about $6,000 worth of bullion weekly, and there is sufficient ore in sight in the mine to run the mill for months. A few months ago the property was encumbered with debt and very little ore in sight in the mine. To-day the company is out of debt and has $20,000 in its treasury.

The Late Storm and its Effects.

The meteorological phenomena developed in this State during the past season have been the most remarkable on record. The frequent thunder storms, during summer, were supplemented by an unusually early setting in of the fall rains, which have been both continuous and abundant, enlminating, for the present, with the very severe storm of Sunday, Monday and Tuesday of last week. The table of rainfall for the season, which we annex hereto, shows that rains have been general throughout the State, although the pluvial favors have been rather unequally distributed. The neighborhood of Petalnma, San Rafael, St. Helena and Santa Rosa seems to have been the most abundantly favored of any portion of the agricultural districts. At the latter place 8.84 inches of water fell in twenty-four hours, as recorded, with only a slight variation by two ganges.

Considerable damage was done by the storm in Sonoma county, and all the way thence to quite a distance up the Feather river. The railroad embankment was badly washed away near Petaluma and Tomales. Much damage was also done along the line of Russian river.

At San Rsfael the rainfall was the heaviest ever known, and the streams were higher than at any time last winter. The streams that rise in the Sonoma mountain were higher than at any time since the memorable winter of 1862.

The Clipper sawmill at Stewart's Point lost logs to the value of $75,000, and the Russian gulch bridge was washed away. About $30,000 worth of grain in sacks was destroyed in Colusa county. About 1,500 head of cattle disappeared from a ranch on the river bottom a few miles below Yuba City. The Feather river was never known to make such a sudden rise as on Monday of last week.

The levee was broken on the west side of the Feather river, near Nicolas; also at Star Bend, ten miles below Yuba City.

We append the rainfall at various localities as we have been able to gather the facts from our exchanges and other sources.

If our exchanges and correspondents will continue their reports (weekly) throughout the season, we will take pleasure in collating them, as above, for the benefit of the State. Rainfall reports, as heretofore given for two or three localities, have very little general value; but such a report as the above, from a great number of localities in all parts of the State is of inestimable value.

Opening up the 1,500-ft. level of the Belcher mine, on the Comstock is just about being commenced in good earnest with every indication of a good yield of rich ore. The machinery of the mine is all in splendid working condition, and sinking the main incline will soon be again resumed.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco

Oriental Steamship Co.—Object: Constructing, purchasing, running, freighting, controlling, managing and owning steam and sailing ships and vessels, therewith doing and transacting all kinds of transportation and shipping business on the oceans, seas, bays, sounds and rivers of the world. The principal place of business is to be this city, and the term of existence fifty years. Directors; Leland Stanford, Charles Crocker, David D. Colton, Loyd Tevis, and Mark Hopkins. Capital stock, $10,000,000, in shares of $100 each. This company is an outgrowth of the quarrel between the Pacific Mail company and the Central Pacific railroad, and an indication that the long threatened new line in opposition to the Pacific Mail is soon to become a reality, and compete for the carrying trade between this country and China and Japan.

Fall Creek M. Co., Nov. 28.—Location: Nevada county, California. Directors—George W. Kidd, John Bell, C. Greatbouse, Sampson Tams and O. P. Robinson. Capital stock $5,000,000.

Amazon Consolidated M. Co., Nov. 28.—Location: Devil's Gate Mining District, Lyon county, Nevada. Capital stock $6,000,000. Directors—James A. Pritchard, J. L. Thorp, J. W. Phillips, F. A. Ronllau and Samuel Miller.

Vivian M. Co., Nov. 28.—Location: Devil's Gate Mining District, Lyon county, Nevada. Capital stock $5,000,000. Directors—A. K. P. Harmon, J. D. Fry, R. F. Morrow, A. M. Edgerton and D. X. Bliss.

Vulcan Coal M. Co., Nov. 28.—Location: Santa Cruz county. Directors—Joshua Gray, Hale Rix, H. D. Jameson, Henry Schunaman and William Schrader. Capital stock, $2,000,000.

Corrallitos Coal M. Co., Nov. 28.—Location: Santa Cruz county, California. Directors—Joshua Gray, Hale Rix, H. D. Jameson, Henry Schumann and William Schrader. Capital stock $2,000,000.

Mammoth Cons. Quicksilver M. Co., Nov. 30.—Location: Lake county, California. Capital stock $1,000,000. Directors—Henry Cohn, M. Weil, E. W. Bradford, John W. Lynch and Jasper O'Farrel.

Garrison Consolidated G. and S. M. Co., Nov. 28—Location: Virginia Mining District, Nevada. Capital stock $7,800,000. Directors—J. D. Prescott, W. H. Farnham, L. H. Nichols, E. Skerritt and Stephen Hewitt.

Mexican M. Co., Nov. 28.—Location: Nevada. Capital stock $10,000,000. Directors—J. P. Moore, O. H. Bogart, R. H. Rodgers, Marshall Hubbard and Charles W. Rand.

Maryland S. M. Co., Dec. 1.—Location: Inyo county, California. Capital stock $3,000,000. Directors—John H. Armstrong, L. H. Edelen, Frank L. Creiper, John C. Burch and John C. Hughes.

Blue Jacket South M. Co., Dec. 2.—Location: Bull Run Mining District, Elko county, Nevada. Directors—Thos. H. Blythe, H. G. Bixby, A. E. O'Neill, J. S. Phillips and W. B. Cluff. Capital stock $5,000,000, divided into 50,000 shares.

Zadig Pavement Co., Dec, 2.—Object: To manufacture and put down pavements under the Zadig patents. Capital stock $1,000,000. Directors—Daniel Meyer, Joseph Brandon Helms, Phillip Zadig, Thomas Price and Gustav Sutro.

Eureka Stone Manufacturing Co., Dec. 2.—Object: To manufacture artificial stone and cover brick walls and roofs with waterproof stone plaster. Capital stock $600,000. Directors—Wm. Flood, Charles J. Pilsbury, Peter Portois, Paul D. Morrell, M. McDonald, A. D. Splivalo and Daniel Sweeney.

The following companies have filed certificates of incorporation in the office of the Secretary of State, at Sacramento:

California Land, Stock, Wool and Manufacturers' Association.—Location: Santa Barbara. Capital stock $1,000,000. Directors—R. B. Westover, Gilber Barber, W. L. Woodruff, Geo. W. Blanchard, Geo. A. Lee.

Bald Mountain Extension G. M. Co.—Location: Sierra county, California. Principal place of business, Downieville. Directors—William Stoddart, Robert Forbes, J. A. Vaughan, W. T. Luther, H. T. Briggs. Capital stock $600,000, in $10 shares.

Coquille Coal and Prospecting Co.—Incorporated at Coquille City, Oregon. The object is to prospect for coal, and acquiring, holding and developing coal lands in the State of Oregon, and the building and equipping of railroads for the use of such coal properties. Capital stock, $240,000; shares $25.

Mexican Land and Improvement Co.—Incorporated at Binghampton, N. Y. Capital stock $15,000,000. The company contemplate extensive mining operations in Sonora and Arizona, but their principal object is to construct a railroad from Tucson, Arizona, to the city of Guaymas, Sonora, or to El Paso. Mr. Blair is in the City of Mexico now for the purpose of obtaining from the Central Government a confirmation of the grants and privileges extended to the company by the State of Sonora. Whenever the confirmation of the Acts of the Legislature of Sonora is obtained from the Mexican Congress, now in session, the corporation say the work will be commenced and pushed vigorously to completion. The incorporators are Cyrus Strong, T. R. Morgan, J. C. Truman and D. B. Blair.

Los Angeles and Inneependence R. R.—Mr. Crawford, engineer of the Los Angeles and Independence railroad, has returned from a survey of the route over the mountains by the way of Cajon Pass, for a narrow-gauge road to Panamint and Cerro Gordo. He has established a practicable grade of less than 140 feet to the mile at the worst point, and most of the distance of less than 100 feet. He speaks well of the route, and says no insuperable difficulty will be encountered anywhere.

Sales at the S. F. Stock Exchange.

The ore body on the 1,500-ft. level of the Consolidated Virginia mine is now developed for almost the entire length of the mine, and at the only point where cross-cutting the ledge has been attempted, it is proven to be 170 feet in width of the richest possible character of ore. The mills are all running, and good returns will be made for the month.

Col. Fitch has commenced operations on a tunnel in the hills above Genoa, Douglas Co., O., that has been for years abandoned. A force of men have been engaged, and the work of prospecting the ledge is to be vigorously pushed.

The Rye Patch mining company is now shipping from $6,000 to $10,000 worth of bullion weekly. The water level has been reached in the mine, and a superior quality of ore has been struck at that depth.

The New Arctic Expedition.—It has been finally decided that Commander Alfred Markham, R. N., shall have chief command of the English Government expedition which starts next May for the Arctic regions.

The new macbinery for the Richmond Smelting Works, at Enreka, which was all manufactured at Marseilles, France, is now arriving at its destination, having been s very long time on its way.

The Auburn mill, at Reno, now charges $35 per ton for redncing silver ores, allowing in bullion eighty per cent. on ores—the assay value of which is $400 per ton or less—and eighty two per cent. on ores of a bigher grade.

Nevada passengers for Panamint go by the way of Independence, Inyo county. The fare from thence to Lone Pine is $30, and from the latter place to Panamint $25.

To settle a bet, a lump of lead from the streets of Virginia was assayed the other day and gave a return at the rate of $9.86 per ton.

The reports from Peavine district, Nevada, continue to be of a very encouraging character.

Ukiah, Mendocino county, California, is the last place heard from which wants a branch mint.

The foundry at Mill City, Humboldt county, is nearly ready for operation.

Calistoga shipped 157 flasks of quicksilver last week.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR COUNTY.

ORIGINAL AMADOR.—*Ledger*, Nov. 28: The Original Amador, at Amador city, we are pleased to learn, improves as work progresses, and is now producing richer rock than was over before found in that mine. A few months ago the Original Amador was supposed to be worthless, but recent discoveries have shown it to be a very valuable mine, with every indication of its being as permanent and productive as any of the developed mines within the great quartz belt of the county. So much for perseverance.

AMADOR QUICKSILVER MINE.—We learn from Mr. George Folger, President of the company owning the above mine, that the ore in the 70-ft. level has increased very considerably in thickness, and that the mine is steadily improving as work progresses. The company have determined to put up reduction works, and with that view Mr. C. H. Turner has gone to San Francisco for necessary material. A large amount of ore is now upon the ground, and the mine proven to contain rich ore from the surface to the depth of 70 ft.; and how much deeper as yet unknown. Within a reasonable time, we shall have the gratification of reporting shipments of quicksilver from the Amador mine.

MINING.—The heavy storms which have prevailed during most of the present week, has materially interfered with placer mining throughout the county, and will during the continuance of the present rains, still further retard the opening up of numerous gravel claims along the line of the Amador canal. Our quartz mines, however, are not hindered by these weather changes, and all are producing their usual quantity of rock. The developed mines are meeting with their usual success, and are daily turning out their general average of gold.

CALAVERAS COUNTY.

SAN BRUNO.—Calaveras *Chronicle*, Nov. 28: The work of putting an engine into the tunnel in the San Bruno mine, at Mosquito, is nearly completed. Quite a large room is being stoped out for the accomodation of the machinery, 500 ft. from the mouth of the tunnel. The smoke from the furnace will escape through a stack extending to the level above. The work of stoping out a place to set the machinery in has been slow, owing to the extreme hardness of the rock. It is expected that the engine and hoisting works will be in position next week when sinking a shaft from the tunnel will be immediately commenced. Should the novel method of working the San Bruno prove successful, it will undoubtedly be adopted in other instances.

SANDERSON MINE.—The work of sinking the shaft in the Sanderson mine, near Railroad, goes on with undiminished vigor. It has already reached a depth of 420 ft. Levels are to be run and stoping commenced shortly. We learn that the ledge is looking first-rate, and that altogether the prospects of the mine are excellent.

WEST POINT DISTRICT.—Work at sinking the main shaft of the Mina Rica is progressing. Down 121 ft. Ore in bottom is of fair quality, and the fissure is widening, although already 5 ft. in width. The completion of the mill has been somewhat retarded by the inclement weather, but is hurried vigorously. The Yellow Jacket machinery and hoisting works have been removed to Miller & Co.'s mine, where it will be used for hoisting purposes. Mr. McNonghton, architect, is superintending the erection. A new superintendent has superceded A. Bateman of the Zacatero. The mine looks well. Rumor has it that the parties who bonded the Josephine have sent an agent here to begin work, forthwith. A new class of men are taking hold of some pretty fair mines; the change is conspicuously beneficial.

FRESNO COUNTY.

QUICKSILVER MINING.—Fresno *Expositor*, Nov. 25: The New Idria company has lately erected a new furnace, the invention of the superintendent of the mine, which is a great improvement on the ones formerly used in reducing the cinnabar ores. It not only does more work, but does it better and cheaper. By the aid of the new furnace the company is able to work ores remuneratively, which had previously been thrown aside as waste. One or two more furnaces of the same pattern will probably be built in the spring. The mines are looking well, and the supply of ore seems exhaustless. The Cerro Benito mine, near Panoche valley, is looking well, and some rich developments are being made. Some very fine ore is being extracted. The Little Panoche mine, in Little Panoche valley, is showing up well. Two tunnels are being run to tap the deposits at the lower levels. In a temporary furnace some 50 flasks of quicksilver were extracted during the summer. The promising appearance of the mines, coupled with late developments, have raised the value of shares in the mines to a round figure.

LAKE COUNTY.

SULPHUR BANKS.—Calistoga *Free Press*, Nov. 28: The Borax company's property, which was sold for about $60,000, is now worth a little over $1,000,000, and is situated 45 miles north of Calistoga. They have one Riotte & Lockhardt furnace, which is producing about 300 flasks of quicksilver per month, and are now constructing a Knox & Osborn furnace, a Walbridge furnace and a bench of retorts. When these are completed it is expected that the mine will produce 100 flasks of quicksilver per day. The new cut exposes excellent cinnabar, and the supply of ore seems almost inexhaustible. About 130 men are employed under the supervision of the popular Harry L. Lightner, who is every inch a superintendent.

MARIPOSA COUNTY.

REPORTED SALE.—Mariposa *Gazette*, Nov. 28: A private letter, from San Francisco to a gentleman in Mariposa, reports the sale of the celebrated Hite mine to a San Francisco company for the sum of $1,100,000—though a later rumor fixes the amount at an even million.

WASHINGTON MINE.—A personal visit to the Washington mine fully corroborates the favorable reports received from that locality during the last two months. Mr. George E. Webber, the superintendent, says they now employ 60 men and have an abundance of paying quartz in sight. They are taking out ore from the 500 and 600-ft. level, and it pays from $22 to $25 per ton in free gold. He estimates the sulphurets at 10 per cent. and they yield not less than $80 per ton by the chlorination process. He uses Schofield's concentratore for separating them from the sand and has discarded his old machines as vastly inferior to Schofield's. The new hoisting works are in perfect order, and every department moves like clock work.

NAPA COUNTY.

NEW DISTRICT.—Cor. Napa *Reporter*, Nov. 28: A new quicksilver district has been discovered a few miles east of Middletown, which is represented as being rich in cinnabar. A man named Smith, a resident of Pine Flat, took up a claim in the new district a few weeks since, and sold a few days ago his prospect to an Oakland company for $1,300. Lakeport is having her share of mining excitement.

ANCIENT MINE.—A Mr. Muir, a mining expert from the California bank, was in our place last week looking after the interests of the bank in this county. While here he explored a cave on Mr. Jackson's ranch three miles north of town. He followed it as long as his candle would allow him, and pronounces it an ancient mine. He is coming back again to give it a more thorough examination and exploration.

NEVADA COUNTY.

COE MINE.—Grass Valley *Union*, Dec. 1: The difficulties which have beset the Coe mine of this place, in the law courts of San Francisco, have all been satisfactorily settled, and the possession of the mining property has been given to the company. Mr. Treadwell, of San Francisco, came up last week and took possession for the company. We understand that the mine is to be pumped out very soon, and that the work of developing the mine will begin at an early day. The Coe has, most undoubtedly, good paying ore in its depths.

MANZANITA MINE. — *Transcript*, Nov. 28: Preparations for working at the Manzanita are all completed, and piping has been going on for several days. A thousand inches of water is used in two pipes. Fifteen white laborers are employed at the mine. There will be a blast of 200 kegs of powder set off this morning at 9 o'clock. Those desirous of seeing the effects can do so by being present at that time. The prospects of this mine never looked better than at the present time. It is reasonable to suppose that the net proceeds the coming year will be entirely satisfactory to the owners.

MAGENTA.—*Foothill Tidings*, Nov. 28: The shaft at this mine is down over 300 ft. and going for the 400-ft. level, when it is thought a fine permanent body of pay ore will be found. The ledge in the shaft is now two feet thick and looks well.

The crown wheel for the new pump works at the Idaho mine, arrived at Colfax from San Francisco several days ago, and Major Leech sent out a team of 18 animals to bring it in. The casting weighs between 10 and 11 tons, and as the roads are not the best, such a load drags heavily. A mile a day is considered pretty good time, but it's bound to come through.

CRATER.—Placer *Herald*, Nov. 28: Work on the Crater mine, we learn from Supt. Greenwell, is progressing finely. Drifting, stoping and sinking are being simultaneously pushed ahead. The St. Patrick mill is pounding steadily on Crater rock, and what is most encouraging of all, the mine is more than paying expenses, something, we believe, it has never done before.

The rains coming on so early in the season caught the miners in many places not wholly prepared. Since the first shower, though they have doubly exerted themselves, and are in most cases ready to begin operations. The indications are that the mining season will open early, and should the winter continue as favorable to the miners as it has commenced, we may count with certainty on an uncommonly prosperous season.

Scales Diggings has some of the richest mines in Sierra. Most prominent are those of the Boyce Bros., who employ a large crew of men a greater part of the year. They are now repairing the old and putting in a new flume. These gentlemen are securing a patent for their mines.

G. Goodell has sold his gravel claim, on Cañon Creek, below Craig's Flat, near the old Port Wine trail, to Ohinamen, for $400. Goodell talks of going to San Francisco.

The Oak Ranch Tunnel is in 1,050 feet, with water enough coming down to run a saw-mill. Track is being shedded for winter's work. Rock is soft; water washes all the dirt out, leaving the hard rock. Four men working in two shifts. If things are all fixed before a heavy storm, work will be continued all winter. Great results are expected from these diggings.

STANISLAUS COUNTY.

GRAYSON MINE.—Stanislaus *News*, Nov. 27: A friend from Grayson informs us that prospecting for quicksilver in the mountains back of that place is being pushed with a great deal of energy. Several companies are at work. Many are developing good indications which are improving daily as they go deeper on the leads. The Sommit Company have started a tunnel and are already in some 90 feet. They expect to reach the lead at a distance of 300 feet in depth from the surface. The Grayson Company is at work sinking shafts. They have reached a depth of 30 feet, and the indications are very encouraging. There are also several other claims that we expect will soon render favorable reports. Both of the claims mentioned have secured patents to their lands.

TUOLUMNE COUNTY.

THE "PATTERSON" LOOMS UP.—*Tuolumne Independent*, Nov. 28: Everything in the Patterson mine, at Tuttletown, is now in excellent condition. They are down with the shaft 230 feet, and are taking out very fine ore with plenty of gold in it visible to the naked eye. Nine men are working in the shaft, and about thirty men in all the mine. The mill is running at its full capacity, which is twenty stamps. The new hoisting works recently erected work to a charm, the same water used is running to the mill to crush, and from thence to the concentrating works. The miners not having cut across, the width of the vein in the shaft is not yet determined.

THE ALPHA GRAVEL MINING CO., T. M.—Have gone to work and retimbered their shaft throughout. In the 1,000-ft. drift they had an up-grade and were obliged to work to a great disadvantage, being compelled to take up from four to eight feet of bed-rock. At the end of the drift at the present time, the ledge has commenced to fall, and superintendent Collins is much elated over the prospect ahead. They commenced to wash gravel on Friday.

BLUE Gravel, Table mountain, are working in their upper slope and have plenty of gravel—their dump boxes are full and they are piling it up around the track. More men would work had they the water to wash the gravel. The reason of this is, the old water company are repairing their flume, and McLean's ditch is not in readiness, as the pipe is not in place, but is expected to be in a few days.

THE Golden Gate mining company shipped in the neighborhood of 7,500 pounds of sulphurets on Friday last to San Francisco.

TRINITY COUNTY.

AT WORK.—Trinity *Journal*, Nov. 28: Billy Waldorff informed us on Monday last, that the miners on Indian Creek had commenced sluicing with plenty of water at that time.

JUNCTION CITY.—Charley Kuper says the late rain made plenty of water for the miners in that section to commence work with, but that they were not ready for it. The high water carried off the foot-log at that place.

YUBA.

THE HANSONVILLE QUARTZ MILL.—Marysville *Appeal*, Nov. 19: About eighteen months ago E. W. Haskell commenced operations on the Hansonville ledge, located twenty-seven miles northeast of this city, by putting up a four-stamp mill and running it by water from the Gaskill ditch. The work has been steadily prosecuted, and the mine is now worked night and day, giving employment to thirteen men. The main shaft has been sunk about 100 feet, and drifts run north and south, where the ledge averages from four to six feet in width. The little mill has been crushing about two and a half tons per day, and the rock is understood to pay very well. This fact appears to be corroborated as Mr. Haskell is in town to procure shafts, cams, dies, tappet, etc., for doubling the capacity of his mill.

Nevada.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—Gold Hill *News*, Nov. 25: Daily yield 400 tons of ore. The ore breasts on the 1,300 and 1,400-ft. levels are yielding splendidly, and show no signs whatever of a diminuition of the yield. The north drifts on both of these levels are still running through rich ore, and there is hardly a doubt now but that the entire ore body from the 1,300 downward to the 1,500-ft. level extends into the California ground. The line of north winzes No. 3 from the 1,200, 1,300 and 1,400-ft. levels are all making excellent progress downward, all in rich ore. Opening up the ore body on the 1,500-ft. level is progressing finely, showing it to be more extensive and richer than the most sanguine believer in the immense value of the mine ever expected.

OPHIR.—Daily yield, 150 tons of ore. The ore stopes on both the 1,300 and 1,465-ft. levels are opening up splendidly, the ore being of even a richer quality than has heretofore been encountered. The mills are all steadily crushing ore from the mine, and the returns for the present month will greatly exceed those of last month.

IMPERIAL-EMPIRE.—Sinking the south winze from the 1,850-ft. level is making good progress, the bottom still in rich ore. The main east drift on the 2,000-ft. level to cut and prospect the ore vein at that point is in much more favorable formation, and may now cut the ore vein at any hour.

DAYTON.—Daily yield, 70 tons of ore. The ore breasts south of the turntable, on the third station level, are steadily improving, both in appearance and the character of the ore extracted. The ore body at this point appears to be gradually widening. The ore breasts on the second station level are yielding finely as usual.

CALIFORNIA.—The connection between the north drift on the 1,500-ft. level of the Virginia Cons. and the corresponding drift from the Ophir mine, is almost completed. As soon as finished this opening will give a complete ventilation of the mine to that depth, when crosscutting the 1,300, 1,400 and 1,500-ft. levels will be commenced.

GOULD & CURRY.—The pump shaft is repaired, and the pump again doing good execution, so that the entire 1,700-ft. level will soon be drained, when some good ore developments may be looked for.

ROCK ISLAND.—The southwest drift has passed through the foot lodge and is now in the clay wall which lies between it and the red ledge. Some bunches of fine ore were cut by this drift near its bottom, which indicates that at a greater depth a good body of ore will be disclosed. A drift will at once be started north from the main west drift to prospect the ledge in this level.

SIERRA NEVADA.—Daily yield, 60 tons of ore. Sinking the new shaft is making steady headway. There is a steady and favorable improvement in the ore developed by the east cross-cut in the old Sacramento ground. The ore body in the north drift from the old Sierra Nevada tunnel is proving a fine development.

GLOBE CONSOLIDATED.—The ore body in the face of the north drift, on the 400-foot level, is widening out and gradually improving in quality.

BELCHER.—Daily yield, 500 tons of ore. The ore breasts on the 1300 and 1400 foot levels are looking well and yielding the usual amount of fine ore. The new air shaft is down 50 feet, the bottom in fine working ground. The drift started west on the 850-foot level is in 58 feet, to a point directly under where the new air shaft is being sunk from the surface. An upraise will now commenced to meet the shaft, and both the sinking and raising will be driven with all the energy possible until the two are connected.

YELLOW JACKET.—Sinking the main incline below the 1,740-ft. level is making excellent headway. Sinking the north winze from the 1,540-ft. level to connect with the north drift on the 1,740-ft. level is being pushed ahead with all the energy possible. The indications of ore developments on this level are certainly much superior to that of either of the last two levels.

KNICKERBOCKER.—The cross-cut on the 700-ft. level is in 90 ft., cutting frequent seams of quartz of a very favorable ore-bearing character, with some water coming in and undoubted indications of soon reaching the main ledge.

SOUTH COMSTOCK.—The shaft down 37 ft. today. Rock hard but blasts well. A temporary house has been built over the shaft which will suffice until the shaft has attained a depth requiring the erection of steam hoisting works.

CHOLLAR-POTOSI.—Daily yield forty-five tons of ore, the assay value of which is $27 per ton. Cleaning out and repairing the main incline below the fifth station level is making much better progress. The bottom of the old works will soon be reached.

CALEDONIA.—Sinking the winze from the 900-ft. level to connect with the east drift from the 1,000-ft. station for air purposes is making rapid headway.

BULLION.—The south drift on the 800-ft. level from the old shaft, running to prospect the ore vein, in the Exchequer ground, is making fine progress.

UNION CONS.—The east cross-cut on the 1,300-ft. level has encountered some fine streaks of quartz during the week, and there is hardly a doubt that the paying body of ore will be yet developed on that level.

UTAH.—The north drift on the 400-ft. level has encountered some fine quartz with much more favorable indications of finding a paying body of ore. The main south drift on the 400-ft. level is also looking quite encouraging.

SUTRO.—The face of the main west drift is in soft working ground. Bunches and streaks of quartz are occasionally encountered, some of which are of a very promising character.

OVERMAN.—The ore developments on the 1,200-ft. level are looking more encouraging every day, and there is but little doubt that when another level is opened up a good paying mine will be developed.

BALTIMORE CONS.—The body of quartz found in the cross-cut on the 750-ft. station is steadily improving in appearance, and there is but little doubt some good ore developments will soon be made.

LEO.—Main tunnel is making fair progress ahead and the ore vein in its face is widening and carrying a better quality of quartz again.

AMERICAN FLAT.—Some fine streaks and spots of ore have been encountered in the main southwest drift on the 750-ft. level, and when the main drift, which has been stopped, is continued, there is every prospect of the opening up of a paying body of ore.

SUCCOR.—The material in the face of the main west drift from the 550-ft. station, is getting much softer and admits of much better progress.

MINT.—Sinking the main shaft is making steady progress. There is no water to interfere with the progress of the work.

The New Power.

One of the most noticeable features of the times is the uprising of the professors. The men who are at the head of colleges and universities ere no longer content with their pupils and their class-rooms. They are emerging in many places from their studies and laboratories, and are enlightening the world upon things which it ought to know. Max. Miller is a world teacher rather than a professor at Oxford. When Tyndall speaks it is from en intellectual Olympus. Not only Belfast but civilization is his audience. Huxley's speculations radiate from his lectnre room to the uttermost ends of the earth. Professor Sumner, of Yale, in a single smell publication, has thrown more light upon American finance than can be found in the multitudinous volumes of Congressional debates. Professor Seelve, of Amherst, hes just been elected to Congress from the Tenth District of Massachusetts, without the slightest effort on his part. He owes his popularity end elevation to an eddress on finance, delivered some time ago, which led his constituents to believe that in the retiring and scarcely known professor they had the law giver of whom they were in searcb. Professor Bonamy Price, of Oxford, is now on a visit to this country. Wherever he goes large crowds of the most intellectnal people flock to heer him on currency and political economy. His last appearance was before the Board of Trade of Chicago. More attention is now generally peid to what Goldwin Smith or J. E. Carnes has to say on a certain class of subjeots than to the most eloqnent politicians. John Stuart Mill exercises a wider influence on humanity than any contemporary statesman, not even excepting Bismarck.

The reeson of all this is plain enough. The professor of to-day hes always something to say that will be of benefit to the world. His labors are no longer directed to the study and contemplation of the antique. He knows more than the history of Greece and Rome. He is skilled in other matters heside the dead lenguages. He has risen above syntex and prosody, and considers there is more in the world needing study than a logic, which, by its subtlety, supersedes the very thing which it wes intended to illustrate. If we were to seek any figure that should at once exhibit the change which has taken plece in him, we should say that he no longer turns his hack upon life, peering into the dead past, but devotes all his energies to the phenomena that are transpiring around him. There are professors who can tell the world more about banking and currency than all the benkers in Christendom. There is no merchant—no matter how long he may have been engaged in commerce—who cannot learn something about prices and exchange from them. We do not know bnt that the lawyer, who, because of his training as a public speaker, has been monopolizing a good deal of the statemenship of all countries, could hear from them, even in his own special walk, something that it wonld be well for him to lay to heert.

The oharacteristic of the thought of the times is that there is nothing too small or insignificant for examination. We have large treatiees on the respiration of plants. Great men are not ahove devoting a large part of their lives to the study of bees and ants. Among the investigations of modern scientists even the beefsteak and the best method of cooking it has a place. The ege is one of inquiry into the familiar things which surrondd us. An explanation of what a man does when he walks, and the machinery which he brings into play, is considered to he of more importance than the geography of the Anahasis of Xenophon. What happens when a grain of wheat is put in the ground—a mystery yet not entirely solved—is a more attractive study than tbe strategy of Hannibal or the absurdities of Commodus. If there be any branch of the past that is being deeply considered it is the remote past. Tho explorations of modern times run rather to Assyrian inscriptions and buried Troys than to the period of Horace and Virgil. We know more about the Rig-Veda than we do of the Berkeleyan philosophy. But the two fields of study—the twilight of things and the present are really closely connected, in consequence of the similarity of the means employed. Schliemann recognizes the pick as the precursor of the pen. The old method wonld have been to critically examine Herodotus—to compare texts and force meanings. The modern method commences with a trench.

Hence it is that the professor is no longer a mere book-worm, who glides through dark corridors, and differs from the musty tomes of the library only in power of locomotion. He is, on the contrary, the most accomplished man of the times. In his retreat he has discovered the meaning of things familiar to everybody, but for that reason imperfectly understood. When he lectures, as a consequence crowds flock to hear him. When he speaks, it is in accents that are carried around the world. He is bonnd, from his accomplishments, to force bis way into the active concerns of life. There will be more heard of the professors in the future than in the past. They are of no profession, though skilled in all.—*Bulletin.*

During October 8,000 tons of coal were unloaded on the Tnckee division of the California Pacific Railroad. The company is probably bringing in a winter supply.

San Bernardino county, California, compriees an area of over 23,000 square miles, and is the largest county in the Union.

Grass Valley Mining Prospects.

There seems to be a good feeling in this community, says the Grass Valley *Union*, about the very near future of the mining industry of the district. While it is trne that the winter has set in at an unnsually early day, and while comparatively few mines are now at active work, yet great hopefulness remains with all our people bere. The owners of "locations" are not disposed to sell out, but are actively engaged in making arrangements to do ectnal work. High prices ere asked for untouched ledges, which show that owners have confidence in their value. In some cases we are disposed to think the prices asked for some mining properties are put too high—so high as to be a bar to early dsvelopments of mines. Still the miners here are those who bnild up this part of the country. Some good farms are here, and meny good orchards and vineyards exist in the foothills, but mining, at last is the bedrock, or foundation, of the prosperity of this section. We are glad to say that the mining busiuess is comiug to the front. Massachusetts Hill and the claims situated thereahouts will soon be worked. Owners of claims there are agreeing about boundaries and about dividing lines, and they are so harmonious that hopes of a consolidation of all the interests can be reasonebly entertained. If the consolidation of the Massachusetts Hill claims takes place, one of the bsst mining properties ever seen on this coast will immediately come into the market. At Deadman's Flat the mines are attracting notice, because they pay their own way and divide a surplus among their owners. The Pittsburg and the Gilbert show well—they do more than a mere showing, they pay. New York Hill continues to give out rich rock from the stopes. A crushing is now going on of rock from that mine, end it will be splendid. The Empire, of Ophir hill, shows well in all its lsvels and openirg. There is a general feeling all around Grass Valley that a good time is coming, in the way of mining, and that it will come very soon.

Quartz Mines in Montana.

There are many persons in Montana who have no faith in the permanency of the quartz lodes. Why this impression prevails we do not know. As well might the same individuals proclaim thet there was no bottom to the ocean, or that some of our mountain peaks touched the sky. The actnal developments npon the quartz mines in this territory look, to one who has had experience in mining, like child's play. Some have gone so far as to sink to a depth of one or two hundred feet upon their lodes, hut instauces of this kind are rare. The majority of the lodes loceted in this territory do not show a developed vein ten feet from the surface. As well might an intelligent Pennsylvanieu expect a hen, by scratching in his garden, to strike an oil stratum or a flowing well, as for a quartz miner to expect to know anything about his lode, until he has seen it to a depth of four or five hundred feet. Soms of tho most promising lodes we ever saw (we have seen hundreds) failed at a loss depth than one hundred feet. The developments made so far in this territory, as a general rule, amount to nothing. There are not more than twenty lodes in Montana that bave excavetions on them to a depth of a hundred feet. The owners of qusrtz lodes should sink npon them until the primitive formation is found, and then they would at least have something upon which to base a calculation for future operations. The belief is almost universal that our mines are the best in the world, but this belief is based solely npon what may bs justly termed surface indications. The development of a single lode to the depth of 800 or 1,000 feet would go further towards determining the future of this territory than all other things combined.—*Helena Independent.*

Hanns vs. Brains.—Nothing is perhaps becoming more evident than the fact that rude labor, requiring only a certain amount of practice end dexterity, is now generally bettter paid than that which involves more or less of education, brainwork and skill. In many places the clerk is not earning half the income of the carpenter. In short, all kinds of manual labor, both skilled and unskilled, are at a premium; while all that is sedentary end involves chiefly, if not exclusively, the work of the brain, has become a drug in the market. Day laborers grumble when receiving only $2 for eight hours work, while clerks can be had by the hundred for $8 or $10 a week, with hours of almost any length. All tbe professions are orowded. The candidates for sedentary work increase at a far more rapid rate than the demand for them, and hence is coming round the strange anomaly that education, instead of fitting the young for earning higher wages and getting on better in the world, is actually becoming a bar to their progress, and condemning them to a life-long course of pinching and unremunerative struggle. The fact is undonbted, whatever may he its cause, and however society may seek to apply a remedy. —*Chicago Inter-Ocean.*

The California Acclimatizing Society reports an increased demand for the Eastern speckled trout for stocking private waters on tbis coast. The society during the present season has sent Esst for 100,000 eggs. It has introduced into the State salmon-trout from the St. Lawrence river and the great lakee east of the Rocky mountains; and other important additions to our stock of fish are contemplated.

Low Freights and Their Meaning.

The application of steampower to ships and to land vehicles has up to the present failed to realize entirely the expectations that have been formed of it. Even in Europe railroads are only now becoming common, and the ocean steamships are, as compared with sailing vessels, few and far between, and the increase in speed, both of vessels and vehicles, has not at all been followed by a corresponding decrease in cost of transportation. In numerous instances quite the contrary has been the fact. It is this which still fiills the clipper ships of the world with cargoes, which makes the commercial marine of Great Britain and the United States still composed of the same kind of craft that have floated on the ocean since the beginning. Through this the merchant in San Francisco has to wait from four to six months for goods from New York that he ought to have had in a fortnight, and the California Wheat shipper has to send his produce in clipper ships that take from two to three months longer than would steamers.

There may he reasons for high steamer and rail freights, but we confess we cannot appreciate them. If the use of steam fails to reduce the cost as well as the length of time in transportation, then it fails in a great measure to fulfill the expectations formed of it. But we cannot see why double the charge should be made by steam for one-half the time by sail, or as sometimes three and four times the charge. No—cheap freights ought to he secured by the use of steam, the general public feel it even if they cannot tell the reason why, consequently one of the great popular demands of the day is that for cheap transportation.

The commercial world, the American portion of it particularly, and that of San Francisco especially, needs cheap transportation. Want of it hurts every interest of the State, financial, commercial, and industrial. This is a subject that we have often alluded to before, and we mean to discuss it frequently in future, at least till the evil complained of is removed. The financial interests of the State suffer by it, in that it lessens the amount of capital by just so much as is paid away over what ought to be a fair rate. The average rate paid for freight on Wheat to England since California first began to export Wheat may he given at £4 or $19.46 3-5 per ton; Wheat can be carried at £2.10 or $12.16 3-5 per ton with profit. It is what is paid now. The difference between them, $7.30 on 60,000,000 centals, the whole amount exported since California first became a Wheat exporting State, amounts to (counting short too) $21,900,000. Not only would the State be so much richer by this amount, but it would have helped to reduce the rates of interest, and thus would have given an impetus to its industrial interests of the State which nothing else could do. It would have made the producer so much richer, and thereby would have rendered trade hrisker, and the State more prosperous. This is just what cheap Wheat freights in the future would also do.

It is not alone, however, cheap Wheat freights that we want; we want cheap Lumber freights, cheap Wool freights, cheap Wine freights etc., cheap freights by land and sea, by clipper, rail and steamship. Cheap freights mean cheap money cheap, Foreign goods and the best possible price for home products.

Cheap transportation for California looks forward to the building up of a great State, with great cities, a great people and great commerce; a State of which its inhabitants will, in the future, he as proud as the Frenchman is of France or the German is of Deutchland. It means that the San Francisco of the future shall be—not a second Venice, Athens, Paris, London, Rome or New York—but far mightier than they, and as much ahead of them as the civilization and enlightenment of the present is ahead of that of the past. Dear transportation means to go back to the era when the red Indian roamed, wild and undisputed, the lord of the continent.

And to all efforts towards breakiug down the monopoly in the carrying trade, we say, Amen, whether it be that of the merchant or farmer; whether it bc in the direction of the railroad or of the steamship or clipper ship; whether it be on Wheat to England or on Case Goods, Merchandise or manufactures to New York or Colorado. —*Journal of Commerce.*

El Dorado District.—We are pleased to learn, says the *Silver State*, that eastern capital is being invested in mining property in El Dorado District. The district ie situeted on the western slope of the Hnmboldt range, about six miles from the railroad, midway between the Humboldt House and Rye Patch. Angus Morrison and Fred Lambing have worked faithfully in the district for several years, and by untiring energy have succeeded in developing a few of the most promising mines snfficiently to attract the attention of capitalists. A Mr. Waldron ie now in the district, examining tbe mines, and is so well pleased with their appearance that he has made arrangements with the owners for their further development, with the view of ultimately purchasing them right ont. The district hes many advantages. It is contiguous to the railroad, and a fine stream of water, large enough for mill purposes, flows through its center. There is also considerable wood in tbe mountains, and a good natural road for a considerable distance up the cañon. Some of the ledges are quite large and well defined, and it is generelly believed that the Rye Patch lode has been found in the district.

Two seats in the San Francisco stock board have recently been sold, one for $15,000 and the other for $17,000.

The Screw Propeller.

Who first discovered the screw propeller is almost universally disputed; Americans, English, French, Germans and Italians all put in a claim, and thet not for an individual of each nation, but in some countries more than one of their sons—or rather their descendants—dispute the honor of being its author. An impartial student will probably come to the conclusion that experiments to discover the means of applying the screw as a motive power to ships were at different periods spontaneously, independently, and sometimes simultaneously made in various places by inquiring minds, who were perfect strangers to each other and to each other's discoveries and appliances. So far back as 1726 David Bushnell, a native of England's American colonies, made experiments by means of a screw to propel a submarine torpedo. Evidently his essays were not successful, or those infernal machines would have been heard of sooner. In 1836, John Smith, an Englishman, formed a company and built the first sea-going screw steamer, appropriately named the Archimedes, from which date the success of the screw propeller was an accomplished fact. Between 1726 and 1836 many inventors took the matter up, but it was not until 1832 that one of the experimentalists, Frederic Sauvage, hit upon the idea of applying steam to the screw as a motive power. Up to that period it had been sought to drive the screw by a capsten manned by men, or other cumbrous and non-practical mesns. In France, Frederic Sanvage is considered to have the largest share of merit in practicelly applying a machine which is the production of many minds, and which even now is being continually improved. The town of Boulogne-sur-Mer, where Frederic Sauvage was born on the 20th of September, 1786, has lately gone to considerable expense in awarding him posthumous honors, which recently culminated in the uncovering of a monument to his memory. The monument over his grave is a square pediment in three portions, made of grey marble, of the same kind as the Napoleon column is built, and obtained from the Marquise quarries. It rises to the hight of 14 feet, and on the top a bronze heroio-sized bust of Frederic Sauvage is placed. On either side of the monument is an inscription setting forth the date of his birth, death—19th July, 1857—the translation of his remains, and a list of his inventions. On the front are the two words "Frederic Sauvege," and a bronze relief showing a vessel with a screw propeller, a pantograph—*procede Collas* —a physonotype, a horizontal mill for sawing marble, and a soufflet hydraulique for raising water, all of which were invented or perfected by F. Sauvage, who, in addition, invented the conformateur, an instrument for measuring the head, the physionométre, and an automatic boat. The bronze bnst and basrelief were modelled by Mr. John Hopkins, an Anglo-Boulonnais, and were cest by Messrs. Thiebaud et Fils, of Paris. Frederic Sauvage's life was similar to those of many other inventors, in that he spent his days and fortune in perfecting inventions which brought him no profit. Having lost his own money, he borrowed from others, and, being unable to repay, was thrown into a debtor's prison, which he afterwards exchangcd for a madhouse, and where he died on the 19th of July, 1857. The monument was designed by M. de Bayser, town architect of Boulogne.—*London Times.*

The Kearsage Quicksilver Mine.

Last Satnrday, says the Lake county *Bee*, we visited the Kearsage quicksilver mine, which is situated about six miles west of Middletown, and fonnd it to be one of the richest mines in the district. The number one tnnnel opens from a face of sixty feet, rnns northeasterly and cnts a ledge running northwesterly, and southeasterly, sixteen feet in width. A shaft is sunk thirty feet from the winze. Another tunnel opens 280 feet on the face of the cleft. The same character of rock is found in these two tnnnels. The third and largest tunnel rnns from the back of the ledge, and is in 690 feet. At 50 feet from the opsning of the first tunnel a rich deposit of ore, eighteen feet in width, has been struck. The ledge struck in the back (third) tunnel is abont the same width, but shows different rock. The compeny bave a bench of three retorts—the largest in the State—now at work, each of which reduces 6,200 pounds daily. They intend immediately to erect several furnaces. There are four claims 600 by 1,500 feet, including the company's property. There are two qualitics of rock in the Kearsage mine—one, hard cinnabar rock and the other cinnahar intermixed with globules of native quicksilver, both being remarkably rich.

A substantial bnilding for the superintendent is now being finished and a number of cottages for the workmen are already built. John O. Hanscom is president of the company, and James McHaffie, secretery. E. T. Armstrong, of Vallejo, and Supervisor J. M. Davis, of Lake county, are part owners of the mine. C. T. Cntler is the superintendent—one of the best on the coast. He has, at present, abont 50 men at work. Tbe company will presently increase their force of men and we confidently predict that, ere long the Kearsege will be one of the leeding quicksilver mines in the State.

The tunnel which has been driven into the North Bloomfield mine, Nevada county, is completed. It is nine thousand feet in lengtb. The flume will be completed in a few daye, and the work of washing will then commence.

Good Health.

Insects as Agents in Propagating Disease.—The article published in another part of this number on the fertilization of flowers by insects suggests some considerations relative to the part which insects perform in the propagation as well as the prevention of disease. It is well known that putrefying organic matter attracts flies and other insects to seek it as a nidus for their eggs, where their larvæ find an abundant supply of food as soon as they are hatched. The ulcerations and eruptions which characterize many infectious diseases attract flies, and it is reasonable to suppose that, after alighting upon an infectious ulcer or pustule, they often carry away with them small quantities of virus, which may infect healthy persons upon whom the insects may subsequently alight. The disease known popularly as carbuncle has been attributed to the action of certain insects supposed to carry with them virus generated in certain diseases to which bovine animals are liable. It seems very possible that small-pox may be communicated frequently in this manner. To what extent insects act as carriers of pollen from flower to flower, does not seem to have been investigated as the importance of the subject demands. That they act also as scavengers, devouring substances the decay of which would pollute the air with unhealthy gases, and perhaps miasm, cannot be doubted; and the old notion that a scarcity of flies denotes an unhealthy season, and *vice versa*, may have a scientific foundation.—*Ex.*

Diphtheria and Croup.—An idea prevails among physicians that diptheria and croup are both diseases that can be prevented by proper attention to hygiene, and can be cured by proper treatment at the beginning of the attack. As to what the hygienic rules and the medical treatment, should be, however, there are differences of opinion. The New York *Times* of the 17th instant publishes a long article with statistics showing that in the last week of October the deaths by diptheria were 12 per cent. of the total mortality in New York city; 14 in Patterson, New Jersey; 8 in Brooklyn; 3 each in Baltimore and Philadelphia, 2 in Boston; 1 in Washington and less than 1 in Chicago, while there were none in Cleveland, Memphis and Nashville. An examination of the cities by districts shows that diptheria is most fatal in places where the ground is swampy, drainage bad, pools of stagnant water numerous, and the dwellings filthy. The epidemic of diptheria was followed by another of small-pox, which was most prevalent in the districts where the other disease had done the least harm. Is there any lesson in these facts for San Francisco?

Decaying Leaves.—The *Sanitary Record*, of London, calls attention to the mischief which fallen leaves are capable of producing under certain circumstances, and especially on heavy lands: "The ground that is strewn with leaves becomes a nursery of morbid influences. The delightful odor that fallen leaves diffuse in woods suggests their harmlessness; but on the roads and walks where the leaves are hourly crushed, and the dropping rain makes a paste of them, they are, without doubt, pestiferous nuisances, which should be removed as quickly as possible by parochial authorities and private proprietors."

Application for Burns.—M. Lebigot, in the London *Lancet*, recommends the following mixture as having been very successful: Cape sloee, four ounces; water ten ounces; alcohol (90°), three ounces. The ingredients are to be melted together in a china plate over a slow fire, allowed to cool, and then filtered; after which three more ounces of alcohol are to be added. It is then ready for use. A tablespoonful of the liquid mixed with a teaspoonful of acetate of lead and twenty tablespoonfuls of water constitutes an excellent remedy. It is to be applied morning and evening on the burnt parts.

Death from Lightning Painless.—Owing to the velocity with which the electric current moves, it is certain that a person struck by lightning has no premonition of the blow which he receives. When we see the zigzag of the flash, we see only the effect produced by the current which has already passed away. Tyndall says: "The nervous system requires a certain interval of time to become conscious of pain. The time of an electric discharge is but a small fraction of this interval; hence, as no sentient apparatus, the nervous system is destroyed before consciousness can set in."

Remedy for Dysentery.—The following simple remedy, says the *Druggists' Circular*, (good authority) has been known to cure the most obstinate and malignant forms of dysentery when all the ordinary methods were ineffectual: Take hot water, one-fourth of a pint; vinegar, half a pint; mix; then continue to add common salt as long as it will be dissolved, stirring and irritating it freely and frequently. Give for an adult one tablespoonful every hour until the bloody discharges cease, or until it acts freely on the bowels.

To Prevent "Day Dreaming."—Study mathematics; engage in solving problems; bring your mind down to matters of fact; read works on natural history, on the natural sciences; give up romance, novels, etc.; try your hand at mechanism; invent and use machinery; finish what you begin and you will cultivate application and prevent the mind from wandering.

Renewing the Body.—When science discovered that the human body underwent an entire change during a period of seven years, it was thought very remarkable, but Dr. Lyon Playfair read a paper a few days ago before the British Social Science Congress, wherein he declared that all the particles of the body change in a space of time even less than a year. The same eminent authority wisely declares that the substance of all our sanitary science, accumulated by the ages, might be summed up in the pregnant advice of the prophet: "Wash and be clean." This learned physician says that for a thousand years after the civilization of the Egyptians, the Jews, the Greeks and the Romans had faded, there was not a man or a woman in Europe that ever took a bath. To this fact he attributes, in a large measure, the wondrous epidemics of the middle ages, which cut off one-fourth of the population of Europe—the spotted plague, the black death, the sweating sickness, and the terrible mental epidemics which followed in their train—the dancing mania, and the mewing mania, the biting mania and witchcraft.

Sugar for Scrofula.—The *Druggists' Circular* says that children of a weak and scrofulous habit should be allowed all the white sugar they desire. It improves digestion and strengthens the blood.

Useful Information.

How the Sun is Studied Scientifically.

When we telescopically examine that brilliant surface which we see daily with the naked eye (the photosphere), to study such of its phenomena as are here described, we do not need the spectroscope, but some means of protecting the eye from the blinding light and heat, and this should not involve the use of any colored shades. If we look into an unsilvered glass, as, for instance, into the panes of a shop-window from the street, we observe that it acts as a mirror, throwing back a feeble reflection of ourselves, or other objects without; most of the rays of which have gone altogether through the glass, while a comparative few are returned to form the image. It may occur to us, then, instead of looking directly at the solar image formed by our telescope, to let it fall on a piece of plain glass, placed diagonally, through which about nineteen parts in twenty of the light will pass and be thrown away, the remaining twentieth being reflected, and forming an exact though enfeebled image.

When this has been done, if the reflected image be still too bright, we may reflect it again, this time only a twentieth of the first twentieth reaching the eye, and so on to any degree; but it is strikingly illustrative of the intensity of the solar splendor, that, when by three such reflections the sunlight has been enfeebled 8,000 times, we yet find it intolerably bright. Instead of more mirrors it is better now to arrange that the third mirror may rotate, so as to *polarize* the light. When this is done the image of the sun appears distinctly, (if the optician has done his work well), colorless, and of any brightness desired.

The instrument thus described in general terms is known as the polarizing eye-piece. All danger and discomfort in studying the sun disappear with its use, and we may look at its unclouded face as though the eye had been strengthened to bear its light; in fact, many hours of scrutiny of the solar disk with this instrument wearies the eye less than a few minutes' telescopic examination of the moon does without it.—*Popular Science Monthly.*

Waste Nothing.—The Chinese, more than any other nation, have reduced the saving of fertilizers to a science. It is well known that they scrupulously save, disinfect, and put to valuable use every particle of offal. In no other way could their land be so enriched as to support its teeming inhabitants. Liebeg traced the primal fall of Rome to the building of her great sewers, which conducted to the Tiber fertilizing material which should have been applied to her soil. It was the lack of breadstuffs, consequent upon the poverty of arable lands, which drove the Romans to foreign conquest, and ended in the overthrow of their own liberty. Our people are wasting every day substances, which, if properly utilized, would save them many a dollar and much tribulation.

A remarkable and very beautiful shade of blue is noticeable upon many of the ancient ornaments found in the tombs of Egypt. Analysis some time since proved the color to be formed by a combination of soda, sand and lime, with certain proportions of copper, from which substances the Egyptians managed to produce three different products—first, a peculiar kind of red, green and blue glass; second a brilliant enamel; and lastly, the color to which reference is above made, and which was used for painting. By synthetical experiments, M. Peligot has succeeded in reproducing this peculiar shade of blue, by heating together 73 parts of silica with 16 of oxide of copper, eight of lime, and three of soda. The temperature should not exceed 800 deg. Fah., as, in such case, a valueless black product is the result.

Wood, saturated with paraffine, it is said, can be used in sulphuric acid works in place of lead-lined casks.

Colored Inks.

The following recipes have been well tested and are commended by good authorities as preferable to the solutions of aniline dyes which are now so extensively used as colored inks:—

Green. Two parts acetate of copper, one part carbonate of potash, and eight parts water. Boil till half is evaporated, and filter.

Blue. Three parts Prussian blue, one part oxalic acid and 30 parts water. When dissolved, add one part of gum-arabic.

Yellow. One part fine orpiment, well rubbed up with four parts thick gum-water.

Red. With the aid of a gentle heat, dissolve four grains of carmine in one ounce of aqua ammonia, and add six grains of gum-arabic.

Gold. Rub gold leaf, such as is used by bookbinders, with honey, till it forms a uniform mixture. When the honey has been washed out with water, the gold powder will settle at the bottom, and must be mixed with gum-water in sufficient quantity.

Silver. Silver-leaf treated in precisely the same manner gives a silver ink. Both these inks may, when dry, be polished with ivory.

Black. Three ounces crushed gall-nuts, two ounces crystallized sulphate of iron, two ounces gum-arabic, and twenty-four ounces water.

White. Fine French zinc-white, or white-lead, rubbed up with gum-water to the proper consistency.

Mode of Ascertaining the Various Kinds of Materials in Mixed Fabrics.—A German industrial journal gives, after M. Vupp, the following treatment for fabrics containing silk and wool, with vegetable fibers. All vegetable fibers resist caustic alkaline solutions, even when boiling, and are dissolved by sulphuric, nitric, hydrochloric acids, even when diluted, with heat. Vegetable fibers when burnt do not give forth any alkalis, especially when hot; the sulphur which it contains combines with the alkali, and the solution becomes black when acetate of lead is added to it. In burning, wool produces the same smell as horn. Silk is dissolved both in the acids and the caustic alkalis, and produces an odor similar to that of wool; but it contains no sulphur, and, consequently, its solution in alkalis is not blackened by acetate of lead. In order to distinguish these materials in a tissue, it is treated first with concentrated hydrochloric acid, cold; the residue is then washed in a filter, and if necessary bleached, by means of water containing chlorine, and then washed again in pure water and boiled with caustic soda, which dissolves the wool, leaving the vegetable fiber intact. The wool is distinguished from silk by adding acetate of lead to the liquid, as already mentioned.

Steam-Power in Europe and America.—Some statistics compiled by the Prussian statistical bureau seem to show that while our American free-traders are lamenting over the decay of American commerce, our country is really one of the foremost nations in the world in the use of steam. In stationary engines the comparison stands thus: United States, 40,191 engines, 1,215,711 horse-power; England, 40,000 engines, 936,405 horse-power; France, 27,041 engines, 325,507 horse-power. We also lead in locomotive engines, viz: United States, 14,223 engines; Great Britain, 10,933; France, 4,933. Total steam engines, both stationary and locomotive, 3,800,000 horse-power in the United States, and 3,300,000 in Great Britain. It is only in ocean steamers that we are behind; viz: Great Britain, 3,061 steamers, 2,624,431 tonnage; United States, 403 steamers, 483,040 tonnage; Germany, 225 steamers, 171,039 tonnage. Before 1880 the account will stand very different. But in the meantime, on land we are indisputably supreme in steam power, being 500,000 horses ahead of England.

Mechanical Treatment of Metal.—It sometimes happens that by centering, etc., the interior diameter of a tire becomes so much too large that it will not fit the wheel. This defect may be corrected according to a German plan, by heating the tire red-hot, and holding it in that condition half immersed in cold water until cold, then heating again red-hot, and immersing the other half the same way. In the first operation the unimmersed hot portion must contract with the portion rapidly cooled, with a corresponding condensation of material, and consequent permanent diminution of diameter, and, in the second operation, a similar effect is produced on the other half. This resort is not confined to tires alone, an instance being recorded where a ring of Bessemer steel, to be used as a flange ring, had been entirely misshaped by an inexperienced workman, and was drawn into shape by heating fifteen times, and cooling different portions.

To Soften Hard Putty.—The following from a correspondent in Falls City, Pa., under date of July 25, 1874, is worth making a note of: "In your number for July you give a method of softening hardened putty by an application of caustic potassa. A plan I have used with great success is to apply a hot iron to the putty; the kitchen poker, bent at the end, answers as well as anything else. The iron should be heated to a cherry red, and applied a sufficient time to scorch the putty, after which the putty can be taken out, leaving the sash perfectly clean. With a reasonable amount of care the sash need not be scorched."

Domestic Economy.

How Often May We Eat?

It has been demonstrated that, at certain intervals, when food is received into the stomach, gastric juice is secreted to digest it, and that no more gastric juice is secreted than is required for the digestion of the proper quantity of food.

If a person eat twice or thrice a day, at regular periods, the gastric juice is secreted by the stomach to digest the food it has received. If, while the food is being digested, more food is introduced into the stomach, digestion (in regard to the food already in the stomach) is arrested. For instance: a person takes in the morning a piece of bread and several potatoes; now, it will take about three hours for the stomach to digest that food. Suppose the person, about an hour after eating this food, takes a piece of bread and an apple or two, what would happen? The digestion that was going on in the stomach would immediately stop, and not be resumed until the food that was received last was brought into the condition of the first. Suppose he took food every hour, what would be the consequence? The stomach would become prematurely worn out, and could do nothing perfectly, working all the time without rest. But if the person possessed a good constitution, and a large amount of vital power, he would not feel, at first, this drain upon his system, but sooner or later he would have to pay the penalty of outraged nature. For instance: a person may have a large capital in bank; he can live upon the interest very well, but he draws upon his capital. He does not feel this drain at first, because he has so large a bank account; but if he keeps on, he will become, sooner or later, bankrupt. Some persons have an enormous amount of vitality—good constitutions. It is said of these persons nothing hurts them—they can eat and drink with impunity. This is a fatal mistake. See how many years of life they are cutting off by such foolishness. If such persons live to the age of seventy or eighty, they might have reached the age of one hundred or more years, by better dietetic habits.—*Science of Health.*

Lemon Syrup.—Lemons are recommended as very wholesome and useful in certain states of the system. People often crave an acid of some kind, particularly in the warm days of spring and summer. When lemons are cheap they should be made into syrup for future use. Press out the juice of the lemon and remove the seeds, which give a bitter taste; separate the pulp from the peel, and boil the former, in the proportion of a dozen pulps to a pint of water, to extract the acid. Ten minutes boiling is sufficient; strain the water into the juice; add a pound of white sugar to a pint of the juice; boil the whole ten minutes and bottle it. One or two tablespoonsful of this lemon syrup in a tumbler of water will make a cooling, healthful beverage.—*Germantown Telegraph.*

Patron's Fruit Cake.—"Mrs. A. M. D.," of Colusa, sends us the following receipt which she thinks housekeepers, whether Patrons or not, will find worth the trial: "The day before you make the cake, stew two cups of dried apples till soft, chop fine and simmer in two cups of molasses from one to two hours. Next morning add one cup of sour milk, two small teaspoonfuls of soda, one cup of sugar, one nutmeg grated, one teaspoonful each of cloves and cinnamon, butter the size of an egg, and flour enough to make as stiff as gingerbread; raisins improve it. Bake with a steady fire. Time improves it and icing will keep it from drying and getting hard.

Keeping Meals Waiting.—Little things often interfere with our comfort very much, and one small annoyance is for men to delay coming to dinner when called. Sometimes they have an hour or more of work which they will do before quitting, and then they go to the house to find the dinner cold, and the cook discouraged. Nothing is more disheartening to a tired woman than a table full of dirty dishes, ornamenting the table an hour and a-half later in the day than usual. Punctuality is a virtue that men should learn if they are in the habit of being uncertain about coming to meals. Any woman worthy the name of housekeeper will be regular with her meals, if it lies within her to have them so.

Rye and Indian Loaf.—Scald three pints of very coarse corn meal (as coarse as that ground for horse feed) with three pints boiling water. Add one gill of molasses and three pints of rye meal (rye graham); mix all together very thoroughly, and make into loaves three or four inches thick. Set on the stove where it will simmer up and not burn, and let it stand until it rises enough to crack all over the surface. Then put into a moderate oven and bake three hours, or bake two hours and steam two hours, or put into a pretty good oven, with a declining fire, at night, and have it ready for breakfast the next morning. Serve warm or cold; better warm.

Apple Tartlets.—Peel six large pudding apples, boil to a pulp, mix with sugar, cloves and lemon-peel, to the taste; let this mixture stand till cold, then mix it with two ounces of dried currants. Make a light puff paste, take a large flat baking tin, and pour the mixture in. Cover with the pastry, and bake half an hour in a very hot oven.

We Will Prepay All Postage

On this paper after the 1st of January, 1875, as the law demands. This is equivalent to reducing the subscription price 20 cents per annum. Besides, it will save subscribers the annoyance of paying petty postage bills every quarter.

San Francisco:
Saturday Morning, Dec. 5. 1874.

TABLE OF CONTENTS.

EDITORIALS AND GENERAL NEWS.—Emerson's Diamond Stone-Sawing Machine, 353. Gravel Mining at Gold Run; Concentrating Ores; Panamint; Notices of Recent Patents, 360. Hydraulic Mining in California; The Latest London Purchase; Whitford's Potato Covcrer, 361. The Rain Storm; Patents and Inventions; Postal Changes on the Pacific Coast; Steamer Lost—Sixty Persons Drowned; Assessor's Office; Melancholy Suicide; Inducement to Honesty; Immouse Land Slide; American Cardinals; Seven Stories; Railroad Accident; Death of Mayor Havemeyer; Coal Mine Accident; Large Marriage Fee, 364.

ILLUSTRATIONS.—Emerson's Diamond Stone-Sawing Machine, 353-361. Whitford's Potato Covcrer, 361.

MECHANICAL PROGRESS.—The Proposed Substitute for Steam; Soldering Broken Files; Elastic Glass; Utilizing Wave Motion; Carbonized Brass; Substitute Wanted for Mica for Stove Lights; Petroleum for Alcohol, 355.

SCIENTIFIC PROGRESS.—Steel Direct from the Ore; The Divisibility of Matter; More Aid to Science; Lord Shaftesbury on Scientific Inquiry; The Use of Tin Vessels; A New form of Electro-Magnet, 355.

MINING STOCK MARKET.—Thursday's Sales at the San Francisco Stock Board; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 356.

MINING SUMMARY.—From various counties in California and Nevada, 357.

GOOD HEALTH. Insects as Agents in Propagating Disease; Diptheria and Croup; Decaying Leaves; Application for Burns; Death from Lightning Painless; Remedy for Dysentery; To Prevent "Day Dreaming;" Renewing the Body; Sugar for Scrofula, 359.

USEFUL INFORMATION.—How the Sun is Studied Scientifically; Waste Nothing; Colored Inks; Mode of Ascertaining the Various Kinds of Materials in Mixed Fabrics; Steam-Powcr in Europe and America; Mechanical Treatment of Metal; To Soften Hard Putty, 359.

DOMESTIC ECONOMY.—How Often May We Eat? Lemon Syrup; Patron's Fruit Cake; Keeping Meals Waiting; Rye and Indian Loaf; Apple Tartlets, 359.

MISCELLANEOUS.—Traps for Sewers and Water-Closets; The Boston and Colorado Smelting Works; Deep Sea Soundings; A $500,000 Suit in Nevada; Gilpin County, Colorado; Rye Valley Mines, 354. The New Power; Grass Valley Mining Prospects; Quartz Mines in Montana; Handa vs. Brains; Low Freights and their Meaning; El Dorado District; The Screw Propeller; The Kearsarge Quicksilver Mine, 358. What Shall We do with Our Cotton? 362.

ST. LOUIS AGENCY.—George P. Rowell, of George P. Rowell & Co., advertising agente, New York City, and Nelson Chesman, late editor of George P. Rowell & Co.'s American Newspaper Directory, have formed a co-partnership nuder the name of Rowell & Chesman, for the purpose of conducting the general business of a newspaper advertising agency in St. Louis. They are hereby authorized to act as agents for this paper, for the reason that we believe them to he honorable and reliable men.

THE Masonville Reduction Works, at Masonville, Colorado, have been leased by a Philadelphia company, and are to bs put in shape and will commeuce running shortly. The works cost considerable, but the company owning them have boon embarrassed so that no work has been done for some months. The works are first-claes in every particular, having a battery of ten stamps, six pans, with a Dodge crusher, and a Stewart furnace. It is designed to erect another furnace, to work by the Hunt & Donglass process, for gold and copper.

IT seems that there are no miners in the Black Hills after all, for General Sheridan reports as much to the Secretary of War. It is possible the report may have originated from the recent discovery of gold forty miles north of Laramie City, on the Union Pacific Railroad, where many miners have gone. This place is at least 200 miles southwest of the Black Hills.

THE Denver (Col.), mint did the following bnsiness in November: Gold bullion received, 4,969 ouncee; value, $84,616. Silver bullion, 7,014 onnces; valne, $10,731. This is a heavy increaee over the corresponding month of last year.

A GOLD bar which weighed 402½ onncos, aud valued at $8,000, wae the result of sixteen days run of the Virtue mill in Baker county, Oregon.

Gravel Mining at Gold Run.

The ahundance of rain falling so early this fall hss had the donble effect of partly filling the ditches and of spurring the miners to their best efforts, to complete their preparations for the winter campaign. Most of them are uow ready, and some of the claims belonging to the Gold Rnn Ditch and Mining company have already started up, namely: "Bay State No. 2," "Gold Rnn," "Pine Top," and "North Star." These claims are and always have been good psying. The Cedar creek compary are also running some of their claims, one at Gold Run, the "Gem," and one or more at Dutch Flat. The mining season may therefore be said to almost have commonced in earneat in these localities though there are many claims that will start np when the ditches get full, ae for instance, the "Goarling Ravine company," the "Miami," belonging to Messrs. J. & R. Haskins and other claims.

The Gold Run Ditch and Miniug Company are also laying their pipes to the old Indiaua Hill claims, wbich will be opeued immediately upon the completion of their shaft and tunnel. This tunuel has heen driven very energetically and is undonbtedly the quickest as it is oue of the hest pieces of work of the kind in the Stste. The main tunnel is 10x12 feet and is intonded to be 2,200 feet long, when it will tap the old 49.54 shaft, which is sunk on tbe channel of the Blue Lead to a depth of about 200 feet in fiue hydraulic gravel; 450 feet from the mouth of the tunnel thoir hrauch for the Indiana Hill claims etarts in; this branch is 8x8 feet, and is now iu over 1,000 feet. It will be run 200 feet longer when their shaft or incline will he raised. Tbey expect to he ready to wash in February. This tunuel was commenced in July 1873; and that it hae heeu run that size and distance through very hard rock in about 16 months (actual working time perhaps not more than 14 month) is certainly very creditable to the mauager. The work has all been done with the Burleigh drill.

That this company will meet with the success tbe magnitude of their work and outlay deserves is certainly the wish of every one, and is almost assured, for they will open near the center of tbe channel of the Blue Lead with a hank of hydraulic ground from 150 to 200 feet deep, and richer thau anytbing worked in Gold Run before; besides the hedrock and strata of cemont lying upon it has beeu proven very rich.

The adjoiniug claim, the Indiana Hill Bluo Gravel Mining company, or as it is ofteuer called the Cement Mill company, is exclusively a drifting claim or claims, as the company has several, They work a breast about 7 feet high and 100 feet wide, employiug ahout 25 men. They crush the gravel using an eight stamp mill, and about 75 inches of water. The mill crushes about 45 carloads in 24 hours, each carload weigbing about 1,600 pounds. Tuis company hae been to work upon the channel of the lead for a good many years, and as a sample of its character wo give the result of their last three years' work, obtained from a reliable source. In 1874 with a nine months' run, they cruehed 10,017 carloads, which yielded $30,811 50, an average of $3 and a fraction; in 1873, with a seven months' run, 6,600 carloads, yielding $24,000, average nearly $4; in 1872, with a four and a half monthe' run, 3,300 carloads, which yielded $19,410, average $5 and a fraction. The cost of production and mining is about $2 per carload. This company is now working a full force of hands and will make the first clean-up for the eeason in a few days.

BENICIA ARTESIAN WELL.—The boring commenced some two or three years ago at the Benicia Military Post, for artesian water, is now down nearly 850 feet, and the engineer in charge, Mr. Banuell, is of the opinion that flowing water will not he found at less than 1,300 feet deep. The cost of tbe well if carried to that depth will not be less than $50,000.

THE SOCIETY OF ENGINEERS of California, held a meeting on Tuesday evening last. W. W. Hanscom in the Chair. Wm. A. Phillips read a paper on "The Properties of Steam," after which somo discussion ensued on the subject. The next meeting will be on the first Tuesday in January, when Col. Lewis will read a second paper "On the Calculation of Earthwork."

FIRST BAR.—The first bar of bullion from the mill of the Prussian Company, Jefferson Canon, was brought in on the Belmont etage last evening. It weighs 92 pounds; is valued at $1,784.40, and is 900 fiue.—*Reese River Reveille*, Nov. 25.

THE hoisting works of the Owene and Helvetia mines, at Julian, San Diego county, will soon be in full operation, when we shall expect to hear of more bullion from that camp.

THE first shipment of base bullion from the Marottee furnace, Sylvania district, Nevada, wae brought into Columbus on the 20th ult. The assay value was $874.80 per ton.

THE lawe of Reese River mining district are to be revised so as to conform to the mining laws of the United States.

Concentrating Ores.

It is said that should the concentrator now being put up in Austin by the Manhattan company prove successful in reducing their ores, the yield of bullion will be immense, ae they have unlimited quantities of ore which assays $100 per ton, but which cannot now be worksd. There is no reason why, if their system fails, some other could not be adopted for concentrating which would prove successful. In Europe tbey pay much more attention to this matter than we do here, and with great profit. They concentrate their ores right at the reduction works heforo working them, and save money that way; while here we ship ores great distances, with heavy freight charges and then work the whole lot without taking the trouble to get rid of worthless gangue. We pay freight on five or ten tons which could he concentrated into one at a cost of not more than the freight would be on two or three tons.

This matter of concentration has been badly neglected on the Pacific Coast. Attempts have heen made in several localities by inexperienced persons to do it, and when they failed, others said it was of no benefit. Concentrating is a process not to he learnt in a day or a week and because a fow have failed to make a success of it, is no reason others should not try it. This question is the most important one before the Pacifio Coast miners. We have found out by sad experience that we are unable to treat certain classes of ores at a profit, yet we know that in other countries oree just as refractory and not half so rich are worked with success. Then we ship this refractory ore away just as it comes from the mine, pay big freights, etc., and evon after that the foreign smelters make it pay.

Now down at Pauamint they are beginuing to sbip ore to England and it costs them $55 per ton. If they went to work and concentrated thie ore say five tons into one, they would make a great deal more money. For five tone of ore the total freight would he $275. Suppose they concentrated this fivo tons into one before shipping; they would then only have to pay $55 and have $220 left to pay for the concentrating. Allow then $20 per ton—a large margin—for coet of concentrating, and they would still save $120 on every five tons. They onght to concentrate their ores for less than $10 per ton, which would douhle the saving given ahove. This is not by any means an isolated case, but a common one. Many districts on this coast are failures for this very reason. They pay high charges to companies for carrying a lot of worthless gangue a long distance, when for half the money thoy could get rid of it. The day will come, however, when the benefits and profits of cuncentrating will be more freely recognized among us.

Panamint.

The Panamint minos still continue to attract considerable attention. Miuers aro leaving for the "excitement" from almost all of the older districts. From acconnte seen in some of our exchanges some of these parties have been having a rough time of it on their travels, from bad weather and roads. At the mines all is bustle and excitement. The Panamint *News* has been issned and from its first number we take the following item: "During the week Panamint has had almost all kinde of weather. Snow fell to the depth of about one inch on Saturday night last, but it has all disappeared now. The fine weather now enjoyed ie remarkable at this season of the year. The town of Panamint now consists of twenty-six frame and board buildings, all covered and occupied, hesides a large number of stockades and tents. Within the next month, if lumher can be had, at least one hundred huildings will be erected.

It is probable that everything worth taking anywhere near the mines has been already located, though new discoveriee will probably be made in the same range of mountaine hy prospectors who take a wide range of country. It is hardly worth while to advise people to wait till spring before goiug to the uew camp, as every one has his owu opinion iu this matter and no doubt hundreds are now on their way thithor, aud hundreds more will go.

The whole range of country within a radiue of a hundred miles or so of Panamint will, no douht, be thoroughly prospected next summer, as many miuers will go down there and he disappointed. The large companies, of course, can only employ a certain number of men and when the quota is filled there will be nothing left for the surplus population to do, except prospect. Still we do not know of a much hetter joh for an old prospector than to get into a comparatively unknown mineral region where the weather is not severe. The hills dowu that way will probably be covered with them in the spring and if there is anything in the country it will have to come out. Then will be the chance for people with a little money to invest, to buy mines cheap. Ae there are no crushing mills or reduction worke the miners will have to sell unless they can etand it to ehip the ore to England as the big companies are doing. The railroad surveye from Los Angeles to Independence have been completed, and as the road runs near the Pauamint mines it will doubtless be pnehed through as soon as possible.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Prese American and Foreign Patent Agency, the following are worthy of mention:

EOO CARRIER.—Joseph Perkins, S. F. Cal. This invention consists of a frame constrncted of tule grass with compartments, each of which is capahle of containing an egg. The elasticity or yielding natnre of the tule grass provides an excellent cushion for protecting the eggs from breakage.

CLOD CRUSHER.—Wm. P. Anderson, Albany, Oregon. This consists of a harrow frame provided with teeth formed of wires, which are hent so as to form inclined teeth, standing iu a line with the direction of travel. Both ends of each wire are secured in one of the timbers of the frame. The dragging of these inclined wire teeth over the ground serves to break up the clod in a more effectual manner than is done by the pointed teeth.

ARTIFICIAL FLOWERS.—Mary Barnes, Truckee. Mrs. Barnes has patented an improvement which consists in the manufacture of artificial flowers out of yarns, worsteds, etc. These flowers, when manufactured out of different colored yarns, are very pretty, and beautiful effects of light and shade can be prodnced by her method.

MINING LANTERN.—Coolidge B. Brown, Placerville, Cal. Relates to a lantern or lamp which is especially adapted for use in hydraulic mines. It consists chiefly of a combination with the main lantern of a small lantern which is capable of adjustment for giving light in any direction in the rear of the machine. Mr. Brown describes numerous improvements in the construction of the large lamp, each ae providing ventilation without unusual draft, preventing too great heat inside the lamp, and the manner of feeding the oil to the burnere, the whole forming a complete mining lamp.

BALING PRESS.—C. P. Littlepage, Thomas J. Hubbard and W. A. Greenley, Big Pine, Inyo county, Cal. Consists in the use of a large hand or steering wheel provided with peculiarly shaped cams, which take up the rope or chain very rapidly at first, and run off into cones, tapering thence to the axle as the balo is finished. With these cams are employed certain blocke or pulleys which serve to draw up the follower, and at the same time to hold tho door or covee at the top, by the manner in which they arr counected.

UPRIGHT PIANO.—Christian Boerner, S. F. Cal. The improvement cousists in securing the irou frame to the wooden frame of the piano in such a manner that a larger sounding board can be made within a certain sized piano. It further consists in a novel method of securing the sound board within the piano so that it can be adjusted with relation to the strings aud bridges, and eecure in a greater degree, the "singing tone," so desirable in this inetrument. The wrest plank is also eecnred in a novel manner, to prevent it from tipping over or springing.

CARRIAGE SPRING.—John Smith, S. F. Cal. This relatee to certain improvements in the heads, which are formed at the ends of elliptio carriage springs, for the purpose of uniting the opposite leaves, with a firm, elastic joint, and it contemplates the manufacture of a head all in one piece of cast steel or malleable iron, so that it can be fitted and welded to the spring with but little difficnlty.

DOOR SPRING.—John Steed and Chas. Naeh, S. F., Cal. Relatce to certain improvements in that class of coiled springs which are employed to operate on doors for the purpose of keeping them closed, the doors being allowed to swing in either direction. It consists in the employment of two cylinders or drume, one of which is contained within the other, the inner one serving as a case for the spring which operates a door turning on pintlee at top and bottom. In combination with these devicee an adjustable stop is employed for the purpose of regulating the tension of the spring. By the the use of certain gigs the spring is made to operate equally well in either direction, while the outer case or drum can he filled with a lubricant, and the whole eealed np tight.

THE CALIFORNIA.—The Virginia *Enterprise* thinks it is not impossible that a body of ore three or four hundred feet in width may be found in the ground of the California mine. Should a body of ore of such great width be found it would not do to depend on timbers alone in working it ont; it would be necessary to fill in the ground with rock in order to snpport the great extent of roof. Theee things are already being thought of. If such developments as that are made, we think it probahle that they will have to resort to thesystem in vogne in Europe, of building heavy arches of masonry to withstand the pressure. That would not cost very much more than timbers at the pricee they are sold on the Comstock, eepecially as the arches would not have to be very close together.

Hydraulic Mining in California.*

No. 2.

Already chasms of a thousand feet vertical depth are successfully crossed by huge iron pipes to convey water to isolated points. The practical test has proven that air can never collect at the lowest point of the inverted siphon, the point where the greatest pressure of water results. Uncalled for as this remark may seem, it must be excused for the reason that actually men of good sense and some engineering capacity expressed fear that air would be carried down with the water to the lowest point of the pipe or siphon, and collect there finally to a great extent under the pressure of two immense columns of water, and might explode at any moment as in an over-charged air-gun. This question was decided like the dispute about "weight or no weight of the fish in water"—not by philosophy, but by practical experiment. After the great pipe of the Spring Valley Canal and Mining Company, of Cherokee, Butte county, was laid across West Branch—a depression of about 900 feet—great care was taken in filling it, and the air valves were carefully watched. These air-valves showed action on that side only from which the pipe was filled; when the column of water rose to the point of discharge not a single air-bubble could be perceived, and the water decanted gently and without a ripple. As the danger of accumulation of air was only feared from pipes conveying water under enormous pressure, the experiment cited above must necessarily dispel all false theories, and it must be acknowledged that the only question in the conveyance of water through pipes is that of sufficient strength of pipe to stand the pressure of the water, be the vertical hight 500 or 5,000 feet.

Thus the field for hydraulic operation is immensely enlarged; almost all gravel deposits are accessible, no matter at what elevation they are found, and the production of gold will keep pace with the development of other great industries of the country.

Legislation.

The Congress of the United States and the Legislature of California have done much by passing wise laws for the protection and encouragement of mining interests; and it is to be hoped that further protection and facilities will be granted where justice and good sense recommend them. How necessary more legislation to protect the great hydraulic mining interests will be must become evident when the unavoidable consequences of hydraulic mining are duly considered. The whole process of hydraulic mining tends to remove mountains of auriferous gravel deposits from their natural position and to transfer their bulks to the valleys below. Where watercourses, like the Yuba, Feather river, American river, and other large tributaries of the Sacramento river are the first recipients of the debris and tailings produced by hydraulic mining, the danger of a serious blockade of the flow of tailings is, to a great extent, removed by the floods, which generally occur every winter season, and culminate, as experience has shown, at least once in ten years, in an immense rush of waters.

These floods clear the rivers to a great extent, and wash the accumulation of tailings into the bay of San Francisco, and perhaps into the Pacific ocean. But where such water-courses are entirely inaccessible, and where only small streamlets (generally known in California under the name of "dry creeks," carrying great volumes of water during the rainy season, but altogether dry in summer and fall) are the natural outlets, or where even these streamlets are wanting and artificial outlets have to be made, serious questions about the deposit and accumulation of tailings arise and threaten to cripple one of the most important branches of that industry, to which California owes her rapid rise and wonderful prosperity.

Since the lands of the United States were thrown into market, farming locations have been made in closest proximity to the mines; in fact alongside of those "natural outlets" which had been used for many years prior as the recipients of tailings, an unfortunate rivalry has arisen between the mining and farming interests of the State; some of the most influential newspapers of the country unqualifiedly pleaded the cause of the agriculturists, and the miner was represented as a mere defacer and destroyer of the face of nature. When it is considered how immense is the area of agricultural land, and how limited, comparatively, the extent of the mineral land, it seems surprising that such antagonism should arise, or that all legitimate means are not used to remove the causes of irritation.

It is evident hydraulic mining necessarily creates an immense flow of debris or tailings, and, therefore, this modus of mining requires not only the introduction of great quantities of water, through long and costly ditches, or the boring of long tunnels, equally expensive, but also facilities for the deposition of the debris or tailings in whatever natural or artificial outlet and place of deposit is offered. If, therefore, this place of deposit for the tailings is denied, hydraulic mining is at an end. On the other hand, whenever the farmer receives his patent from the United States he is sole master of his quarter-section, and can and must protest against any trespass on his property. Should his property cover the only outlet to the richest mining region in California, and even should this outlet have been used for twenty years as the recipient of the tailings, the farmer's rights would not yield to any priority, and the only way to dispossess him of his farm would be to buy him out at his own price.

It might not deserve the name of hardship if the miner were called upon, in a few isolated cases, to secure the legitimate pursuit of working his mines by paying enormous prices for land thus necessary to him; but when whole townships would have to be acquired in this way, and when farming locations were made more for speculative than for agricultural purposes, such proceedings would become the most offensive tyranny.

The proximity of these lands to some of the great gravel channels of the country has enriched them more or less with fine gold, in such a way that the question whether they are truly mineral or agricultural may arise, and at the same time impoverish them by thick layers of volcanic debris, sand, and other unfertile materials. Common sense declares that such lands, as a whole, are not fit for agriculture. Where exceptions occur let them have their full weight; but even then it must be borne in mind that certain portions of the lowlands flanking the great gravel-streams of California are as necessary to hydraulic mining operations as water or deep pasces themselves.

The General Land Office has withdrawn some of the lands in question from the market, an act of justice which deserves the highest praise; but, nevertheless, these lands may be thrown open to entry again, and then the question will arise.

The miner pleads that the lands are necessary to him as a place of deposit for his tailings; that without them work in his mines is altogether stopped; that millions of dollars have been spent in improvements, and that these improvements will be almost a total loss in case these lands are deeded away by the United States Government; that the right of way for canals and ditches, granted by the United States Government, must necessarily include the right of in and out; that the water coming in is generally pure; that the water going out is surcharged with tailings, and must necessarily commit damage of some kind unless discharged into a stream large enough to carry all tailings along; that the Government has granted this right of way over its own land; that the outlets for tailings were used under this authority long before the United States parted with the property, and that therefore the right of way ought not to be alienated from the miner, and all damages legitimately and necessarily originating from it ought not to fall to his responsibility; and that a new disposal by the United States of the lands necessary as an outlet to the miners would be an act of injustice.

Could not these lands, worthless for agriculture but indispensable for mining, be altogether withdrawn from the market, leaving them open for all mining operations of the vicinity, so that no individual interest could enter upon them? Should a settler go upon these lands he might do so at his own peril, reaping for the time the benefit of their use, without being entitled to damages whenever the tailings overwhelmed him.

Congress might appoint a commission of competent men to investigate and report on the lands in question, and the farmer would no longer run the risk of settling in good faith on lands which would only yield trouble and lawsuits to him; nor the miner fear to see his valuable improvements made worthless, or the proceeds of his mine swallowed up by enormous payments for damages.

The question about the disposition or placing of tailings assumes such importance in view of the increasing hydraulic-mining interest, that the writer has considered it his duty to point to the future with a warning finger. The three great principal requisites of successful hydraulic mining are, first and foremost, a gold bearing gravel deposit; second, and not less important than the preceding one are the facilities for outlet and deposition of tailings; third, an abundant permanent supply of water for mining and purposes.

Whitford's Potato Coverer.

MINING DECISION.—In the case of the Mono mine in Utah, the Commissioner of the General Land Office has just rendered a decision in which he cuts down the application to 1,400 feet, but suspends further proceedings in the case until the adverse claims of the Magnolia and Shoo Fly mines are settled in the Courts, and rejects the adverse claims of W. A. Rocks. The following points were decided in this case: First, where a party who commenced suit after the date of application for a patent, and afterward found an adverse claim which is irregular in other respects, the application for a patent must be suspended until the matter is decided in the Courts; second, a party who has only an equitable interest in a mine cannot be considered as an adverse claimant.

THE OPHIR MINE shows improvement at almost every point where work is being done, with the strongest possible indications of still richer developments on the 1,700-ft. level when cross-cutting in that portion of the mine shall have been commenced. The *News* thinks there is but little doubt that the rich body of ore extending downward from the 1,300 to the 1,465-ft. level is simply a continuation of the great ore bonanza of the Virginia Consolidated, which extends through the California into the Ophir, and perhaps through the Ophir into the Union Cons.

The Latest London Purchase.

The Manta Mine near Lincoln, Placer county, California, is one of the very few American mines which have lately been placed on the English market. The Company owning the property is known as the Manta Mining Company, (Limited), London. There is a five-stamp mill on the mine and five more stamps are being added by the English owners. They are also putting in a pump, hoisting works, etc. There is a shaft on the mine 240 feet deep, and three levels have been run. The ledge is a gold-bearing one about two feet wide. We are told that the ore is very similar in appearance to that of the Idaho and Eureka mines in Grass Valley, in both the characteristics of the vein stuff and the mode of occurrence, but not having seen it are unable to speak of our own knowledge. The vein at the bottom of the shaft is 4¼ feet wide, although it only shows 11 inches at the surface. The rock is said to be very uniform in its pay value, and is expected to work about $40 per ton.

This mine was placed in the English market for the sum of £50,000, and if it is worth anything at all ought to pay a decent dividend on the comparatively small capital stock. It is to be hoped that the mine will be made to pay, for our English friends have been bitten so badly of late that they deserve some recompense. California is in better repute there than most of the Pacific States and Territories, and if a few small mines were successful, it would lead the English public to invest largely here. The only trouble is that they are apt to pay too much for their mines. The Manta is considered a modest mine when placed at $250,000, but there are many properties here with as wide ledges and higher grade ore which the owners would sell for $25.000 or $50,000 to capitalists if they could. It is to be hoped that our English friends have made a good bargain, but whether they have or not we do not know, as we have no knowledge of the mine.

Whitford's Potato Coverer.

The implement represented by the annexed engraving is designed to be used chiefly as a furrower and coverer for potatoes, but it is also well adapted for hilling and ridging for Sweet potatoes and other root crops. Our illustration represents it as arranged for cutting the furrows. The furrow guides, *A*, having a steel share on their forward ends, form two parallel furrows, the bottoms of which are right angles. It is claimed that a man can drop the seed much faster in this furrow, as the potatoes will not "jump," and must fall into line.

After the furrows are made and the potatoes dropped, the implement is turned over, bringing the plates, *C*, down. This is quickly done, by first removing the handles and detaching the thills. The handles are made reversible by means of the tie-brace, *B*, which is hinged to one transverse piece of the frame, the upper end of which enters a socket on the handles and is secured therein by a set screw. The front portion of the handles is attached to the other transverse bar by a bolt. After the handles and thills are readjusted the machine is drawn by the horse so as to bring each furrow midway between the ridging plates, the soil is gathered between the latter at their front ends, and delivered at their contracted extremities, thus forming a neat ridge. The plates and guides are adjustible to any desired width of ridge or space between the rows. When it is desired to change the direction, as at the end of furrows, it is only necessary to lift the handles slightly, when the tongue, *D*, will enter a recess formed at the front end of the handles, and, bearing against it, will enable the horse to assist in lifting the machine clear of the ground, so that it can be turned without difficulty. In this cheap and simple machine the inventor—who we are informed is a practical farmer, has united three useful implements—two plows and a ridger. And when it is remembered that, with rare exceptions, our farmers raise potatoes by the old slow hand processes of a hundred years ago, it will be seen that this invention will supply a long felt want.

This implement was patented August 4th, 1874, by Le Roy Whitford of Harmony, Chautauqua county, New York. L. B. Cox & Co., 197 Water street, New York, are to manufacture the potato coverer.

ANOTHER snow-plow, after the style of the famous "No. 1," is being constructed at the railroad shops in Sacramento, and will be completed in about two weeks.

THE Silver City *Times* says the mines in that vicinity never presented a better appearance than at the present time.

"THERE are now only four miners working on French and McCullough creeks, B. C., who make about $5 per day each.

What Shall We do with our Cotton?

That California, during the few seasons in which experiments in cotton-growing have been conducted here, should effectually prove that she can snccessfully compete with any cotton-growing country, both in the quality and cheapness of this material, is a matter which can scarcely be considered "without our special wonder." Another matter somewhat surprising, is the fact that one of the pioneer cotton growers of the State, Col. John L. Strong, who has probably contributed more than any other man to the successful production of the raw material, has now taken the front in advocating the establishing of cotton manufactories in California, to convert the prodnct into all the fabrics for which it is available. The San Francisco *Call*, of November 15, contains an exhanstive article on this subject, written by Col. Strong, of which we propose to give a brief synopsis.

Elaborate and convincing statements are given, showing what cotton manufacturing has done for England and the United States. He says: "It is only 73 years since the British export trade in cotton goods was covered by the small sum of $15,000,000; and in 1871, 71 years after, the products of British looms from raw cotton, reached the almost fabulous sum of $493,476,880. In 1787, the first cotton factory was built in the United States; and in 1869, 72 years later, Hon. David A. Wells, Special Commissioner of the Revenue, reported the value of goods produced $184,000,000.

It is stated that the cost of the raw material consumed in England during the calendar year 1871 was $197,556,120, and that the increased value imparted by manufacture was $265,617,790, or about 130 per cent. Mr. Wells states the value of raw material consumed by American mills in 1869 at $112,500,000, and the increased value imparted by manufacture $71,500,000. It is proper to remark that the results of the year 1871 were predicated upon cotton at a cost of 16¼ cents to the British manufacturer, a consequence of the war between Prussia and France, while, in the case of American manufacturers in 1869, the results were predicated upon cotton at a cost of 25 cents per pound.

Similar and even greater benefits, it is claimed, may be secured to California by converting cotton into manufactured articles. After presenting some carefully prepared tables exhibiting the profits derived by Great Britain from her cotton manufactories, the writer brings the matter a little nearer home, as follows:

An equally impressive illustration of the value of manufacturing industry, as a contributor to prosperity and powers of communities, is found in the progress of cotton manufacture in the New England States. Without entering into any elaborate consideration of that progress, we may understand its results from the following table compiled from a report to the Legislature of Massachusetts upon the condition of her factory operatives.

Table showing capital, annual average dividends and market value of the stock in the principal cotton factories, from 1862 to 1869.

Name of Mills.	Average Dividends.	Capital.	Value of Stock. Mkt. val.	Par val.
Chicopee	26½ per cent.	$4,200,000	$ 325	$ 100
Merrimac	15⅝ " "	2,500,000	1,700	1,000
Middlesex	22½ " "	750,000	100	100
Naumkeag	19⅝ " "	1,500,000	167	100
Pacific	21⅛ " "	2,500,000	2,200	1,000
Salisbury	22½ " "	2,000,000	360	100

Mr. Strong is not alone, by any means, in the persistent, far-seeing effort to work up this material in the places where it is grown. The true friends of the cotton growing States of the south are using their best efforts to establishing cotton factories at home. The following extract from an article written by ex-Governor Patton of Alabama, and published in *The South*, April, 1873, is used by Mr. Strong to fortify his position.

"The city of Lowell, Massachusetts, was founded in 1822. It now contains cotton mills with an aggregate capital of $13,600,000. They are operated by 13,500 employes, mostly women, girls and boys. These establishments have 448,180 spindles, and 12,160 looms. They consume about 65,000 bales of cotton annually. This cotton, at $80 per bale, is worth $5,200,000, and by the labor of the 13,500 operatives its value is fully trebled; that is, when it leaves their hands it is worth at least $15,000,000. Now, let it be observed that this raw cotton, worth but $5,200,000, required for its production something like 22,000 laborers' strong hands. This statement will serve to show the great disparity in the value of labor employed in raising cotton and manufacturing it into yarns and cloths."

Mr. Gillman, of Texas, is also quoted, who, in the course of a long and able article urging the erection of cotton factories in that State, speaks as follows:

"There are general expenses incident to manufacturing cotton which bear much heavier upon small than upon large capital engaged in it; hence, it is more profitable to operate with from $200,000 to $1,000,000; and for the comparison to be made, I will suppose an investment of $200,000 at some point in Texas, near the railroad, and assume that as good a mill can be put in operation for that sum, as in Lowell at the present time.

"We have in our favor a mild climate, admitting of cheaper buildings, and such abundance of territory that many land-holders will donate one thousand acres to any company that would locate on their lands, and we have against us the freight and charges on such machinery as would of necessity come from abroad. Mechanical and operative labor is as cheap to day in Texas as in the North, and all the building materials requisite for a cotton mill are as cheap here as there, and a large portion of the machinery can be made here, of better quality and as cheap as there; therefore, it is safe to assume that a mill of the same capacity can be put into operation for about the same cost here as there.

"A first-class, fire-proof, brick and iron building, with all the machinery, cottages for operatives, house for agent, store-house, saw and planing mill for preparing lumber, brick, etc., can be completed of the capacity for working up ten bales, or 5,000 pounds of lint cotton per day, from the seed, and working the seed into crude oil ready for market, for $200,000 currency.

"In operating such a mill with seed cotton, the labor of ginning and lapping ready for the cards would be no more than opening, beating and lapping from the bale, as now practised. Therefore, our Texas mill would gain the usual toll of one-tenth for ginning in the purchase of seed cotton.

Acknowledging that our mill, working 3,000 bales annually into cotton fabrics, makes a profit of ten per cent on the $200,000 capital, we have	$20,000
Ten per cent. or 300 bales, is made by ginning, which, at $50 per bale is	15,000
Bagging and rope, freight, insurance, commissions, press charges, loss of weight and damage, wharfage, brokerages, and weighing, as before stated, $25.50 per bale, 3,000 bales	76,500
Net product of oil and oil cake per bale, $32.75 on 3,000 bales	98,500
Net profit of Texas mill in one year on the investment of $200,000	$209,750

"The Lowell mill, of the same cost and capacity—less $100,000 for the oil machinery, and making the same profit on manufacturing the same amount of cotton into the same quality of fabrics and getting the same price for them—makes $20,000 only on the investment of $190,000. And why? Simply because they have to pay: First, for ginning the cotton, one-tenth, and the charges of $25.50 per bale in the advanced price of cotton; and second, they lose entirely the profit from the oil and oil cake of $32.75 per bale.

"Mills in the South, now operating with small investments and purchasing their cotton in the bale, have but little, if any, advantage over foreign mills operating with large investments, whose reduced general expenses are about equivalent to the small portion of charges saved by the Southern mills purchasing cotton in the bale.

"It would be very gratifying to see our own people gather up this wealth in which they are literally wallowing; but, if from any cause or combination of causes, they cannot do it, foreigner's capital most certainly will, sooner or later, for the reason that the local advantages of the cotton-growing region are incapable of transmission to other points."

We will close the review of this able article with a few brief extracts, which bring the matter still nearer home to the producers, manufacturers, and capitalists of California:

"The question comes home to California, just entering upon her career as a producing state, whether, possessing all necessary material within her limits, she will not utilize it in building up that permanent prosperity which characterizes the localities we have been reviewing.

As a manufacturing state she must enter into competition with the established industries of both old England and New England, and her hopes of success must be based upon such economic production of raw material, combined with abundant motive power, and cheap food for operative labor, as will counterbalance the advantages afforded by the long experience and overwhelming capital of her competitors. That she possesses all of these advantages in limitless abundance it is our purpose to show."

"The capitalist of California is content to realize 1½ per cent per month upon his investment, and here is a promise of five. May we not appeal to these gentlemen to relieve us of this vassalage to Europe and New England, which, as producers and importers of staple crops, we must endure forever? Stop, we beseech you, this drain of our life blood away from us; which, in time, will exhaust our vitality and leave us only decay and ruin. To you, gentlemen, it offers no inviting prospect after our destruction. The conditions upon which a continuance of your harvest must rest is our prosperity, not our annihilation. Build factories for us, and let us convert our own products, that we may no longer be subject to the dual action of supply and demand for raw material and manufactured goods, and consequently to the dictatorship of a single market as to price. Free us, through this conversion of raw products, from all depressing influences exerted upon trade, except such as arise from a plethora of manufactured goods. In affording us this relief, you open to us, without restriction, the markets of the world."

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Ituly, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawiugs and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

THE SCIENTIFIC PRESS.—This valuable journal entered upon the seventeenth year of its publication on the 4th of July. The steady advance in character, that every reader has noticed in the paper, renders it unnecessary to make any splurge of improvement, and the publishers simply content themselves with the announcement that they will continue to make their paper as interesting as possible. That it is interesting to a large class of readers, the wide circulation and extensive influence of the PRESS, is sufficient evidence.—*Placer Argus.*

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.

This compound of the vegetable alteratives, Sarsaparilla, Dock, Stillingia and Mandrake with the Iodides of Potassium and Iron makes a most effectual cure of a series of complaints which are very prevalent and afflicting. It purifies the blood, purges out the lurking humors in the system, that undermines health and settles into troublesome disorders. Eruptions of the skin are the appearance on the surface of humors that should be expelled from the blood. Internal derangements are the determination of these same humors to some internal organ, or organs, whose action they derange, and whose substances they diseass and destroy. AYER'S SARSAPARILLA expels these humors from the blood. When they are gone, the disorders they produce disappear, such as Ulcerations of the Liver, Stomach, Kidneys, Lungs, Eruptions and Eruptive Diseases of the Skin, St. Anthony's Fire, Rose or Erysipelas, Pimples, Pustules, Blotches, Boils, Tumors, Tetter and Salt Rheum, Scald Head, Ringworm, Ulcers and Sores, Rheumatism, Neuralgia, Pain in the Bones, Side and Head, Female Weakness, Sterility, Leucorrhœa arising from internal ulceration and uterine disease, Dropsy, Dyspepsia, Emaciation and General Debility. With their departure health returns.

General News Items.

POSTAL CHANGES ON THE PACIFIC COAST.—The following postal changes have been ordered for the Pacific Coast: Postmasters appointed—George Hogeman, at Bell'a Station, Santa Clara county, California; Lewis H. Wiseman, at Kirkville, Sntter county, California; Henry Wsebington, at La Porte, Plumas county, Caliiornia; Byron D. Beckworth, at Lodi, San Joaqnin county, California: Jobn W. Middleton, at Hamilton's Fort, Iron county, Utah. Office discontinned—Lake Mente, Polk conty, Oregon.

STEAMER LOST—SIXTY PERSONS DROWNED.—The steamer La Peata, from Gravesend, for Rio Grande del Sud, foundered off Ushant on the 29th of November, and sixty persons were drowned. Fourteen persons were rescned by the Gareloch, of Glassgow, from a boat in which they had been floating twenty-fonr honrs. The ateamer was engaged in repairing an ocean telegraph. Her loss is attributed to having on board a heavy grappling apparatus and 250 miles of telegraph cable.

ASSESSOR'S OFFICE.—Serions irregnlsrities have been discovered in the Assessor's office in this city. Assessments against favored persons have been marked down, by whom it is not yet known. In a few cases, in one volume, these cases were fonnd. One by which $27,000 was made to read $7,000, another by which $7,200 was made to read $1,200, and a third by which an assessment of $50,000 was changed to $30,000. There are 39 volumes in all, which will be carefully exsmined.

MELANCHOLY SUICIDE.—On the 28th nlt., Captain Thnrston, a resident of Galt, and once a member of the Legislature from San Joaqnin county committed suicide by shooting himself with a pistol. Captain Thnrston had been suffering for many years from a cancerous tumor on the head, which seems at last to have become nnbearable, and to have been the inciting canse of his snccessful attempt at self-destrnction.

INDUCEMENT TO HONESTY.—Jones and Sharon, the senatorial team from Nevada, bave the trifling income of $2,000,000 a year apiece. What object could a salary grab be to these meu? If they abould happen to forget to draw their annnal salary they could probably get home if tbey did not hold a "full hand" of passes.—*Chicago Tribune.*

IMMENSE LAND SLIDE.—A great land slide occnrred on the eastern side of Mount Tamalpais, soon after the late storm. Tbe slide extended from the highest peak to the canon below. Tbe slide appears to be over 100 feet wide, and carried trees and rocks before it witb impetnous force. A smaller slide occnrred on Monday last on Telegraph hill in this city.

A TROUBLESOME BEAR, one which hss been committing many depredations in tbe region of Clear Lake, Sonoms conuty, was recentlr killed by George Goodman. He was known by his peculiar track, caused by a wonnd in one of his feet. He weighed 900 pounds. A reward of $100 had been offered for its hide.

THE RENTON COAL CO. are now delivering coal to its snbscribers in San Francisco and Oakland at $8 per ton, and to other customers at greatly redneed rates from those of other dealers. Their coal, which is a good article, still improves with the developements on the veins.

AMERICAN CARDINALS.—It is reported that at the next Papal Council to be held at the Vatican, two American Bishops will be raised to Cardinals. These, if so appointed, will be the first American citizens who have ever been elevated to that dignity.

THE LICK SALE has attracted much attention in the Atlantic Statee on account of the magnitnde of the total purchase money and tbe generons zeal of Mr. Lick for the public welfare. The New York *Tribune* says it waS the most remarkable auction sale recorded in history.

SEVEN STORIES.—The seventh story of the Palace Hotel has been completed and tbe mammoth building is now being roofed in. Work is progreseing upon the structure nigbt and day—some 200 gae lights being reqnired for tbe night work.

RAILROAD ACCIDENT. — Lewis H. Graves, freight conductor, fell from the train while in motion, on Monday last, about two milee west of Stockton. He fell between the cars and was instantly killed.

RUBBER SPONGE is a novel and useful article introduced in the East, samples of wbich have found their way to California. From appearance it combinee the qnalities of lightness and elasticity witb durability.

DEATH OF MAYOR HAVEMEYER.—Mayor Havemyer, of New York, died suddenly of apoplexy at his office in the City Hall on Monday. He had over-exerted himself in walking, which brought on the attack.

"THE Hawaiian Kingdom" is tbe official title of His Majesty Kalakaua'e dominions. The words "Sandwich Islande" are not used at Honolulu. The name of the king, spelled—Kalakaua, is prononnced Kalla-kah-oo-a.

THE Spaniards have captnred, in Cuban watere, a small vessel flying tbe British flag Much interst is manifested to learn the particulars, and to see how the English, Government will receive the report of the act.

THE LOMPOO LAND SALE.—The resnlt of the sales at Lompoc may be snmmed up thns: The stockholders paid $500,000 for the property and sold $700,000 worth of it at auction. An offer of $350,000 for the balance was refused. The stockholders have evidently made a big thing; whether the late purchasers will do well remains to be seen. The snccess of this enterprise, as well as that Anaheim, Riverside, etc., ahows the feasibility of emigrant colony schemes in this State. We would suggest, however, tbat the emigrants rather than speculative middlemen should be allowed to reap at least a portion of the benefits to be derived from the increased valnes of tbe land.

POISONED GEESE.—A lot of wild geese were lately killed on the San Joaquin river and given to hogs to eat. The next morning the hogs were found dead. It is thonght that the geese were poisoned from feeding in the fields where fsrmers have nsed phosphorus or strychnine to poison sqnirrels, and the hogs were thus also poisoned. A warning which should be heeded by tbe consumers of wild geese in this city and elsewhere.

DEBRIS FROM THE MOUNTAINS.—A gentleman, who had the opportnnity of observing, says tbat the amonnt of sand of last week which came down tbe American river when it rose on Tuesday was almost beyond belief. It came along in vast waves, with a lond, rushing noise, almost like that of a train of cars, and for some time there was appsrently more sand than water moving.

GRAPES PLENTIFUL.—So plentiful and cheap have grapes become in the vicinity of Stockton that the owners of excellent vineyards propose to root out the roots and vines together, and devote tbe land to other crops. Better convert the poor vines into better, by grafting—say into raisin grapes.

LEVEEING NEAR STOCKTON.—J. M. Fisher, superintendent of the Tide Land Reclamation Company, No. 162, has seventy-eight Chinamen at work leveeing on the Calaveras slough, near Stockton. The levee costs bim 13 cents a cnbic yard.

A NEW TRADE.—The Starr mills at Vallejb have taken large orders for flonr from Central America. The first consignment of 3,000 barrels will go down by steamer shortly, and otbers will follow at intervals.

THE Sacramento river rose, nnder tbe influence of the late storm, to 19 ft. 4 in. above low water mark, on Wednesday of last week. Since then it das been gradually decliniug.

COAL MINE ACCIDENT.—Tweuty-fonr persons were killed by the lste explosion in tbe Warren Vale Coal Mine, Yorkshire, England. Ten men were rescued more or less injnred.

LARGE MARRIAGE FEE.—The marriage fee paid to Archbishop Alemany on the occasion of the Newlands-Sharon msrriage was a check for $5,000.

THE P. O. departmeut has run behind, tbe past fiscal year, about eight million dollars, on a total expenditure of about thirty two millions.

SUPERVISING ARCHITECT, John McArthnr, Jr., of Philadelphia, has been tendered the position to be vacated by Snpervising Architect Mullett.

BURIED IN A SNOW-STORM. — Ten travelers were recently bnried in a terrible snow-storm on the Alps. All perished.

CONGRESS meets on Monday next. The President's message will be looked for with unusnal interest.

STRIKE TERMINATED.—The great 'longsboremen's strike in New York has terminated. The strikere finally snccumbed.

BURIED IN A SNOW SLIDE.—Five men were buried in a snow elide at Alta, on tbe 25tb nlt. They were dng out badly injured.

WELCOME TO THE KING.—San Francisco bas nearly exhausted iteelf during tbe past week in doing bonors to King Kalakaua.

THE deaths in San Francisco last week were 38 males and 42 females.

A RUPTURE in the French Cabinet is considered immiuent.

THE Erie Canal is to close for the season to-day.

STRAWBERRIES are atill to be had in thie market.

ALL tbe mills on Crown Point ore are running up to their full working capacity, and there ie no prospect of any diminution of the yield for tbe preeent month. The ore breaste on 1,300, 1,200 and 1,000-ft. levels still continue to afford a steady yield of rich ores.

THE Virginia and Truckee railroad now handles 1,100 tons of oie a day.

NEVER GIVE UP.—If all the cases in which *Hale's Honey of Horehound and Tar* has cured inveterate and apparently fatal coughs, could be made known, every consumptive in the land would take heart and commence, in hope, a course of this most wonderful preparation. Physicians who have exhausted their list of pulmonics, without benefit, recommend it as a last resort, and even in the worst extremity its effects are astonishing. But it should he the first resort, not the last. It is impossible for any disease tending to consumption to retain its hold, if met in the early stagee with this powerful vegetable remedy.

Pike's Tooth-Ache Drops—Cure in one minute.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIO PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Dec. 1st, 1874.

FOR WEEK ENDING NOV. 17TH, 1874.*

MACHINE FOR MAKING BOTTLE COVERS.—Earl K. Cooley, S. F., Cal.

QUARTZ MILL.—Samnel H. Cowles, Sacramento, Csl.

EXPLOSIVE COMPOUND.—Joseph W. Millard, S. F., Cal.

TRADEMARK.

FOR DAIRY SALT.—The Union Pacific Salt Co.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwiee) at the lowest rates. All patent business for Pacific coast inventors tranacted with perfect security and in the shortest time poseible.

Wanted—More Woolen Mills.

Twenty-seven tbousand bales of Wool stored away in city warehouses, with no prospect of being sold for some months to come, is the reverse of pleasant for our Wool Growers and Commission Merchants. Before the end of the year there will be over thirty thousand. This Wool cannot be sold. It is not on account of its bad quality or dearness, for it is cheap enough in all conscience; but we depend entirely on the Eastern markets, and Wool is not much sought for there just now. Retrenchment and short time are the order of the day among the Woolen Manufacturers of tbe East, and during the Winter they can be only expected to buy from hand to mouth. This is a sore setback to our Wool Growers, and is generally injurious, for it represents a sum of at least a million and a quarter of dollars kept out of circulution.

What has happened once may happen again, and we doubt how often we may have in this way to suffer from the effects of panics, not at all of our own creation. The only way to obviate the possibility of such a thing happening over and over again is to encourage the manufacture of Woolen Goods in California and on the Pacific Coast, to add to the capacity of our present Woolen Mills and to establish new ones. There is plenty of room for them. The Pacific Coast is a large consumer of fabrics either wholly or partially made of Wool. The value of those imported cannot be less than twelve millions of dollars. The value of Woolens and mixed Cotton and Woolen Goods now manufactured on the Coast is three millions of dollars, while the amount of Wool consumed is three million pounds. Did we manufacture all our Woolen Goods, and those in which Cotton and Wool mixed are used, we would consume here twelve million pounds more of Wool, a matter that would be of the highest interest to our Wool Growers, altogether apart from any industrial considerations. Did we need so much for home consumption the present year, our warebouses would not be filled up with (for the present) unsaleable Wool.

In the manufacture of Woolen Goods there is everything in favor of California and Oregon. Labor is cheap and water-power abundant, while tbe factories can purchase tbe needed supplies at their very doors. And there is no need to restrict production to the extent called for by local requirements. California Blankets have ere now made quite a reputation for themselves in many localities of the East; carloads of them have at times been shipped over the Railroad, and the Government laid in supplies in this way from articles we manufacture at our city mills. With greater experience and skill even a better account could be given. With skillful workmen imported from France we could make fine Cloths, not only for the Pacific Coast of the United States, but we could find markets in British Columbia, the Sandwich Islands, Mexico, Central and South America, China, Japan, and even Australia.

Tbe manufacture or Woolen Goods should be one of our specialties, for we have the raw material, taking rank as among the best in the world, abundance of labor, abundance of water-power, and an almost virgin market. As it is, the industry is rapidly growing; but it is needful that it grow faster. Tbe number of Sheep and the number of pounds of Wool are increasing rapidly year by year. If it continues to increase at its present rate it would reach 120,000,000 pounds in 1880. The only sure market for Wool, Wbeat or Wine is at home, and we hope to see in a few years California and Oregon in a position themselves to manufacture all the Wool produced on this Coast.—*Journal of Commerce.*

THE steady continnation of the ore body in the eonth winze from the 1,850-ft. level of the Imperial-Empire mine, taken along with the fact tbat it is known to be gradually spreading and widening as well as becoming richer as it is developed downward, hardly leaves a doubt but that a rich mine will be developed on the 2,000-ft. level.

THE mineral lands upon Puget Sound, W. T., are attracting the attention of capitaliets, and within a very ehort time 1,100 acres of coal land in King county has been disposed of at the rate of $10 per acre.

DEWEY & CO.,

American & Foreign Patent Agents,

Tbe best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign conntries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. Tbey refer to the thonsands of inventors who have patronized them, and to all prominent business men of tbe Pacific Coast, wbo are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the infinence of our carefully read and extensively circulated jonrnals, we are enabled to illustrate the intrinsic merits of good patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave tbe name of the article, and the namo of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIO PRESS OFFIOE, SAN FRANCISOO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made np, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straigbtway to the Patent Office at Washngton

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made np with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless thcy are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and wbat is desirable to claim.

Address **DEWEY & CO.,**
PUBLISHERS, PATENT AGENTS AND ENGRAVERS,
No. 224 Sansome street, S. F.

The Mining & Scientific Press

Started in 1860, is one of the oldest weekly journals now published in San Francieco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid hy us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mieeissippi.

As a PRACTICAL MINING JOURNAL it has no rival on thie Continent.

It ie the only MECHANICAL, and the only SCIENTIFIO journal of the Pacific Statee.

Miners, Assayers, Millman, and Metallurgist in the United States should take it.

Pacific Coast Mechanics, Engineere, Inventors, Manufacturers, Professional Men, and Progressive and Industrial Students should patronize its columns of fresh and valuable information.

Mining Engineers, Superintendents, Metallurgists, Mine Owners and Mine Workers throughout the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Intelligent thinkers throughout the land, in high or humble situation, who would avoid literary trash for gennine information, shonld SUBSCRIBE AT ONCE.

DEWEY & CO.,
No. 224 Sansome street, S. F.

AGENTS WANTED to canvass every town on the Pacific Coast for the MINING AND SCIENTIFIO PRESS, PACIFIO URAL PRESS, and the ILLUSTRATED PRESS. Experiencedcanvassers preferred. Good men can make large wages besidee learning much and improving their talents

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY CUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein mines and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth, $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

CAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

THE MINING AND SCIENTIFIC PRESS, San Francisco, we regard as the best paper for miners published anywhere in the world. Subscribers should be careful to put on file each number; and each year's edition, bound in a volume, would prove a most valuable book to all reading men engaged in mining or in the reduction of ores.—*Boulder News.*

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 63 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

THE
AMERICAN TURBINE WATER WHEEL.

Recently improved and submitted to thorough scientific tests by James Emerson, showing the following useful effect of the power of the water utilized, being

THE HIGHEST RESULTS EVER KNOWN.

Percentage of part gats, ¼ 50.08; ½ 69.64; ⅝ 78.73 ¾ 82.53; ⅞ 82.90. Percentage of whole gate, 83.14.

Mr. EMERSON says: "These are the best average results ever given by any Turbine Wheel in my experience."

A splendidly illustrated descriptive catalogue, or any further information desired, furnished on application to

TREADWELL & CO.,

Mining and Other Companies.

Theresa Mill and Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Coultervills District, Mariposa county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on this twenty-fifth (25th) day of November, 1874, an assessment (No. 1) of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 16, 408 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on Wednesday the thirtieth (30th) day of December 1874, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the 15th day of January, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale. J. W. TRIPP, Secretary

Office, Room 16, 408 California street, San Francisco, Cal.

Electric Minining Company—Principal

place of business, San Francisco, State of California. Location of works, Lincoln Mining District, Butte County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 24th day of November, 1874, an assessment of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States Gold coin, to the Secretary, at the office of the Company, in San Francisco.

Any stock upon which this assessment shall remain unpaid on the fourth day of January, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday the 25th day of January, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

T. B. WINCARD, Secretary.

Office—Room 13, No. 318 California street, San Francisco, Cal.

Mansfield Gold Mining Company—In

accordance with a resolution adopted at a meeting of the Board of Directors of the Mansfield Gold Mining Company, held this day, a special meeting of the stockholders of said company is hereby called, to be held at the office of said company, in San Francisco, No. 321 California street, room 1, on Monday, the 21st day of December, 1874, at 1 o'clock P. M., to take into consideration and act upon the proposition to increase the capital stock of said company from nine hundred and ninety thousand dollars, divided into thirty-three thousand shares, of the par value of thirty dollars each, to one million, nine hundred and eighty thousand dollars, divided into sixty-six thousand shares, of the par value of thirty dollars each. Also for the transaction of any other business that may properly come before the meeting.

R. COULSON, President.
J. HISHFELD,
J. E. HILL,
F. W. VOLL,
J. L. SMITH
} Directors.

San Francisco, Nov. 20, 1874. no28-4t

Land Purchaser's Association— Office

No. 331 Montgomery street, room 7, San Francisco, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment, (installment No. 42) levied on the 28th day of October, 1874, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
John A Callison	20	1	$10 00
Thomas H Day	21	2	20 00
P A Eakins	210	3	30 00
D S Hutchinson	65	1	10 00
M A Hutchinson	105	1	10 00
Otis Jackson	180	2	20 00
W E Mayhew	206	3	30 00
Mrs N McCarty	147	1	10 00

And in accordance with law, and an order of the Board of Directors, made on the 28th day of October, 1874, so many shares of each parcel of said Stock as may be necessary, will be sold at public auction at the office of the Secretary, 331 Montgomery street, room 7, San Francisco, California, on Thursday, the 24th day of December, 1874, at the hour of 12 o'clock, M. of said day, to payseid delinquant assessement thereon, together with costs of advertising and expenses of the sale.

C. S. WRIGHT, Secretary.

Orleans Mining Company—Location of

principal place of business, San Francisco, California. Location of works, Grass Valley Township, Nevada County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 16th day of October, 1874, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Charles Platt	9	59	$59 00

ROBT. P. CHASE,
A. F. BENARD.
} Directors.

SAN FRANCISCO, November 12, 1874. 12v29-4t

Machinery.

BALL'S SWEEPING DREDGE,

A NEW AND VALUABLE

CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is hnt this one machine that has ever had these improvements employed. It is an old machine, formerly hnilt for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cnhic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported hy leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now helonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed hy a machine hnilt by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine hy actual work:

I will ehter into an agreement with any responsible party to hnild and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cnbic yards per minute. But it shall he further agreed that in case (at a fair trial to he made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minnte, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thns dredged per minute, and for additional fractions of a cubic yard thns dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to nse the same in a limited territory, for $20,000 on the same plan as above stated, hut will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to he made in U. S. gold coin on delivery of machine, as may be indicated hy agreement.

Address; JOHN A. BALL,
9v28-tf Oakland.

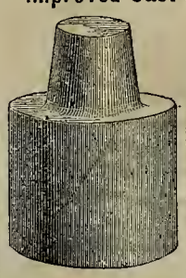
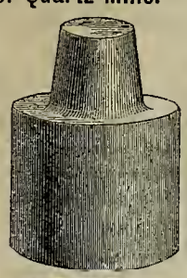
Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.





[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enahled to reduce the cost of steel and at the seme time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that yon will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or hy our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened hy the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very hrittle and are not capahle of heing tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam hy absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 60 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to

1v29-3m CAST STEEL SHOE & DIE CO., Room 1, Academy Building, S. F

TEATS' PATENT FURNACE.

TEATS' PATENT FURNACE

For Roasting, Desulphurizing, Chloridizing and Oxidizing Ores, etc. For the reduction of Gold, Silver, Lead and other ores, saving a largor percentage, at less cost, than any other invention now in use. Chloridizing Silver ore more thoroughly, in less time, with less fuel, salt and labor; also roasting Lead ore preparatory to smelting, better and cheaper than any other invention. The Furnace is so constructed that one man, of ordinary ability, tends five or more furnaces; controls them with ease; adding heat or air; stopping or starting at will; charging and discharging with ease. Also, Patent "Conveying Cooler," for conveying and cooling roasted ores, heating the water for amalgamation and the boilers at the same time. Saving the large space in mill (covered with brick or iron), and the labor of two men per day, exposed to the poisonous chlorine gases. Also, Patent Air Blast "Dry Kiln," for drying ores direct from the mine or breaker, saving fuel and labor heretofore necessary in drying ores for dry pulverizing. For description refer to Mining and Scientific Press, No. 18, October 31, 1874. For particulars address

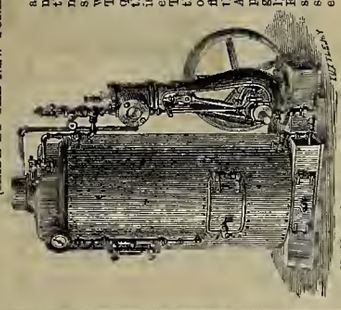
TREADWELL & CO.'S
(IMPROVED)
Upright Safety Engines and Boilers.
(MADE BY THE NEW YORK SAFETY STEAM-POWER COMPANY.)

We would call particular attention to the graceful design and simple construction of this Engine and Boiler, which is not only pleasing to the eye, but is also, that which secures the greatest strength and rigidity with a given amount of material. The Boilers, which are of the Upright Tubular style, with internal fire box, are of the best material and workmanship, and are all tested to 150 pounds per inch. The heating surface and area of grate are in excess of the quantities usually allowed for the same power, and it is therefore unnecessary to purchase a greater rated power than is actually required, while in cases of emergency these boilers can be depended on for more than their rated power. The Engine is not fastened to or upon the boiler, and is therefore not affected by expansion, nor are the bearings or pillow blocks attached to the boiler, thus avoiding the heating of the latter, and securing perfect steadiness under the high speed which is necessary for economy of fuel. All parts are easily accessible—a great advantage. Is complete in itself as a Portable Engine and Boiler, or the Engine can be detached from the Boiler and run independently, if required. Its main points are simplicity, Safety and Economy. For printing offices, laundries, tanneries, ranches small repair or machine shops, or for hoisting, wherever a small and safe power is required, they are peculiarly adapted. Over 500 are already in use.



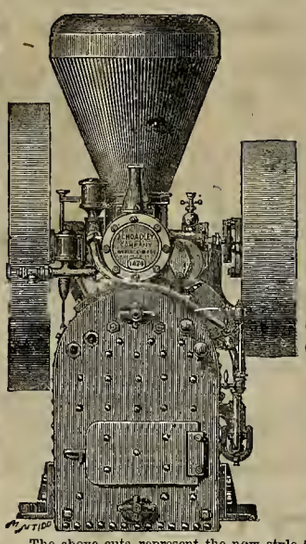
All Sizes from 2 to 10 Horse-Power.

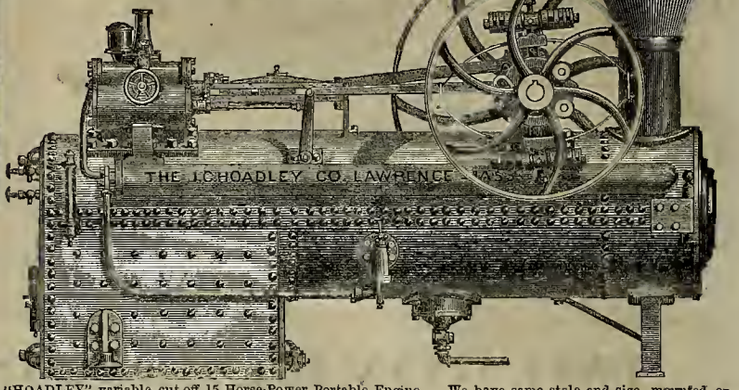
TREADWELL & CO., Sole Agents, S. F.

THE "HOADLEY" PORTABLE STEAM ENGINE.

From 3 to 40 Horse Power.

ALL SIZES
Hoadley's PORTABLE Engines
Sole Agents TREADWELL & Co





The above cuts represent the new style "HOADLEY" variable cut-off 15 Horse-Power Portable Engine. We have same style and size mounted on wheels as a Threshing Engine for the Russell End-shake Separator. We have all sizes from 3 to 40 horse-power on hand. The HOADLEY ENGINES need no recommendation from us. We have sold them in California for 20 years, and every year has added to their improvements. The last great improvement is the Cut-off Governor, thus giving them all the economy and increased power of the most thorough built stationary engine.

☞ Millmen, Mine-owners and Mining Superintendents, and all who intend buying engines, will do well to examine carefully the merits of the "HOADLEY" before purchasing. Circulars and prices sent free on application. Address

4v29-6m-16p

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering two or four sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter,—galena and silver sulphurets from pyrites, baryta and quartz; and pyrites from quartz.

Added to a battery of stamps these machines constitute a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 15 or 20 tons per 24 hours.

For particulars apply to,

Hydraulic Mining in California.*

No. 3.

The Deep Gravel Deposits of California.

These deposits occur in basins, channels, or river beds, differing in depth, width, and length like the living streams, ponds, or lakes of the present day. The deposits themselves, consisting of gravel, drift, or shingle, sand, and clay, differ in size of boulders and compactness of the different stratifications, as well as in their composite parts. They consist of the detritus of all classes of rock known in California, and have received evidently their gold from the quartz, which appears either in bowlders and pebbles, or in sand, throughout these immense deposits. The great and noted channels containing these deposits run from north to south, and are indicated by gravel-ridges and table-lands, the latter very often covered with lava, basalt, or other volcanic matter, such as ashes and scoria. Figure 1 shows the bed-rock, rim-rock, pipe-clay and gravel of one of these deposits.

Springs inside of the rim-rock are sure indications of a deep channel or basin. The rim-rocks, or in other words the shores, or banks of the ancient stream, must once upon a time have been high enough to confine the gravel-deposits within their limits. For instance, a gravel-deposit appearing to-day in the shape of a table-mountain, must have represented, in a former age, the shape of Fig. 2, and gained its present appearance only through the agency of water, which destroyed those portions of the rim-rock and gravel deposit lying outside the dotted lines marked in the figure. The cause which partly destroyed the rim rock or shore of the channel, and left high plateaus or table-mountains as isolated landmarks of the ancient gravel-stream, has undoubtedly, to a great extent, obliterated every surface in relation to the existence of such a gravel-deposit; or even destroyed the last vestige of gravel deposit and channel, by creating gorges for modern rivers, which cross the ancient gravel streams nearly at right angles, and many hundred feet lower. As an instance, the table-mountain in Plumas county, known as Walker's Plains, and the table-mountain near Cherokee, in Butte county, both of the same formation as to gravel deposit etc., may be cited. These two table mountains were once evidently parts of the same great gravel stream, but are at present separated by a distance of about thirty miles, and by gorges of more than a thousand feet in depth, forming now the beds for the West Branch and North Fork, both tributaries of the Feather river. The practical miner has known for a long time that these deep gravel streams may be discovered by following the presumptive course of the ancient river, though all outward indications have disappeared; and, to sanction the view of the practical miner, and, at the same time, to show how beneficial is the application of science, it may be added that only recently valuable deep-gravel deposits were developed, indicated by the geological survey of Professor Whitney, though hidden under mountains of apparently valueless detrital matter

Adaptability for Hydraulic Operations.

Almost all gravel deposits are fit for hydraulic operations, provided they are gold-bearing and will admit of those improvements which are essential to this class of mining, to wit, sufficient outlet, a place of deposit for tailings, and abundance of water. After gaining the certainty that these requisites can be obtained, the miner may go to work to open his mine, confident of success. If already other mines are worked in apparently the same gravel deposit, he may be pretty sure to find the same stratifications of gravel, cement, clay, sand, etc., and he must then judge for himself whether it will be advisable for him to drive at once a tunnel, or to ascertain first, by shaft or incline, the depth of the basin or channel.

Should the nature of the ground admit the sinking of a shaft or incline, it would be advisable to do so, even after the tunnel is completed, water introduced and everything ready for hydraulic operations, the opening of the mine will have to be done either by shaft or incline. It is, however, very often, and particularly in those deep gravel deposits which

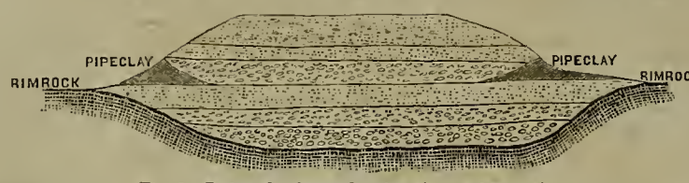

Fig. 1. Bed-rock, rim-rock, pipe-clay and gravel.

were never submitted to drainage, a costly and difficult job to sink a shaft or incline, by reason of the quicksand and loose gravel. The miner must therefore consult the extent of his means before he ventures upon hazardous operations.

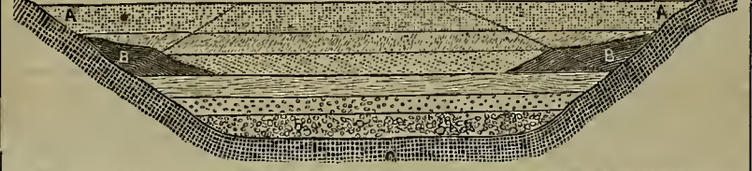

Fig. 2. A A, old rim-rock; B B, pipe-clay; C, bed-rock, or bottom of channel.

The character of these ancient deposits, generally speaking, is the same. Though they may differ in the hardness and compactness of the gravel, or may have been disturbed by local influences, still there is a prototype, the description of which may fairly apply to all. The oldest gravel-deposit found in these ancient channels is that drift deposit known under the name of the "blue lead."

The Blue Lead.

This deposit is always found deepest in the channel and nearest to the bedrock. It is composed of bowlders of serpentine rock, talcose slate, and, in fact, all other rocks belonging to the slate family; besides this, of quartz in bowlders, gravel and sand, with an admixture of clay, the presence of the latter being always considered a favorable sign of richness. The whole mass is of a color varying from bluish green to indigo blue. The quartz, though originally of pure white, is tinged blue, and neither washing nor exposure will discolor it. Very often a deposit of huge boulders, rather rough and angular and intermixed with only a little gravel, is found near the rim-rock—a mass resembling very much a moraine, and of no value for mining purposes. This deposit, however, will slope down toward the center or depth of the channel or basin, and the regular blue lead will appear on the top of this "moraine," sometimes only a few inches in thickness, but gaining steadily in size in the same ratio as the "moraine" diminishes, till finally the bedrock is reached by the blue lead, which may have gained a thickness of 40 feet or more.

This blue lead is found in deposits rising from a few inches to over a hundred feet in thickness, and is generally considered the richest and most reliable gold-bearing deposit in the country. Though tightly packed, it can be easily removed by the pick, and affords, therefore, under proper circumstances, an excellent material for hydraulic operations.

*Condensed from an article by Charles Waldeyer, in the last Annual Report of the U. S. Commissioners of Mining Statistics.

Stump Sawing Machine.

J. A Elston, of Elston Station, Cole county, Mo., has recently patented a machine which is designed for cutting off tree stumps, so that all kinds of farm machinery will readily pass over without obstruction. It consits of a strong saw, sprung in arc shaped and pivoted to a swinging frame—*A*, which is applied by a central sleeve to a smooth shaft sustained in a supporting frame. The saw frame is provided with handles at each end, so that one or two men may operate it. A cord attached to its center passes over the pulley *B*, on the supporting frame, and carries a weight, which produces the forward advancing and feeding into the stump. The supporting frame consists simply of inclined legs pivoted to and secured by nuts on the ends of the horizontal shaft, the elevation of the shaft above the ground and the consequent raising or lowering of the saw is provided for by spreading the legs and fastening them in the required position by arc shaped guides *C*, and set screws, the lower ends of the legs are pivoted to base runners, *D*, to admit of a steadier seating on the ground. Suitable handles on the machine serve to carry the machine from stump to stump. The mode of arranging and operating the machine is clearly shown in the engraving.

The machine is cheaply made and the inventor informs us that its usefulness has been practically demonstrated, doing the work with rapidity and ease, leaves the stump in concave shape, so as to retain moisture and facilitate its rotting.

ELSTON'S STUMP SAWING MACHINE.

CRYOLITE.—John B. Winters is said to have discovered a field of cryolite, 60 miles northeast of Reno, Nevada. Cryolite is a substance of white or yellowish gray color, occurring in masses of a foliated structure. It is a double fluoride of aluminum and sodium, and there are large deposits of it in Greenland. It is employed as a raw material in the manufacture of aluminate of soda, which is available instead of caustic soda in the purification of fatty matters. It is also used in making a porcelain like white glass and various valuable chemical products are obtained from it.

MICROSCOPICAL SOCIETY REUNION.—The quarterly reunion of the San Francisco Microscopical Society transpired on Friday evening last, and was attended with gratifying results. The affair was informal and the ladies and gentlemen present reaped both pleasure and profit from the exhibitions and incidental discussions. Among the guests of the society was W. H. Walmsley, of Queen & Co., Philadelphia, who exhibited some fine specimens through an excellent microscope. Mr. Walmsley pronounces the rooms of the society the finest in the United States, and he assures the society that they have reason to feel proud of their progress and position.

A. DUNCAN, of Duncan's Mill, Sonoma county, is having a steam propeller built, expressly adapted for the lumber trade. Her length will be 100 feet, 25½ feet beam. Her engines will be 100 horse power, and her carrying capacity 150,000 feet of lumber. She will make four trips a month to San Francisco. The steamer will run exclusively to Duncan's mill, and will be the first of the kind on the coast.

THE Placer *Herald* says there are rich copper lodes in that county, only needing developing to make somebody rich.

AT the railroad shops in Sacramento they have lately been making some street cars for this city.

THE St. John mine, Solano county, shipped eighty flasks of quicksilver on Thursday.

PROSPECTORS are hunting for cinnebar in the vicinity of Jacksonville, Oregon.

THE new Belcher air shaft is going down pretty fast. The new shaft will be in excellent ground, and in every respect will be as good and substantial as the shaft which was destroyed by fire a few weeks since.

THE Sutro tunnel was advanced 270 feet in November.

Bringing Water to the Mine—Heavy Hydraulic Mining Operations.

The work of bringing water to the mines on Dutch hill, Plumas county, is nearly completed. The *Plumas National* gives a detailed description of the undertaking, from which we extract as follows:

A party of gentlemen, composed chiefly of Sacramento capitalists, having purchased the mines near the North Fork of Feather river, and lying about six miles south of the Big Meadows in this county, known as the Dutch Hill, Barker's Hill, Cummings' Hill, and Owl Hill mines, incorporated under the name of the North Fork Mining company, with a capital of half a million, consisting of 20,000 shares at $25 per share, for the purpose of working the same. These mines had long been known as among the richest in Plumas county, but situated as they were on an isolated point, at a great altitude, it was deemed impracticable, and by some *impossible*, to bring water upon the ground; but this company, knowing that the quality of their ground would justify an immense outlay, had surveys made, and upon those surveys have constructed ditches and laid a line of pipe, and in ten days from the present writing will see at least 2,000 inches of water upon their claims.

The water privilege of the North Fork Mining Co. is all the waters of Rice's creek, flowing through Rice Creek Meadows. This water was purchased by the company from Henry C. Wilson, Esq., of Tehama, who held the meadows under a swamp land patent issued by the State of California. Rice creek heads under the south side of Lassen's Butte, and is continuously fed from melting snows, and is the extreme westerly branch of the North Fork of the Feather river. It contains at its very lowest stage about 3,000 inches of water (miners' measurement) thus affording a never failing supply.

Surveys demonstrated only one practicable route for the water, viz: crossing the ridge into Tehama county, thence carrying the ditch on the south side of the point or ridge dividing Butte creek from the Big Meadows. This could only be done by means of a tunnel 1,150 feet long, starting sufficiently low to tap all the waters of Rice Creek Meadows. The contract for building this tunnel was let to Angus McIntyre, of Indian valley, for $8 per foot, the work to be completed by the first of December. To finish this work within the time specified, it was necessary to sink two shafts on the same line, and between each end of the tunnel, thus affording a chance for six gangs of men to work at the same time, one set of men at each end and two sets in each shaft, working in opposite directions: and even with this force it required the best management on the part of the contractor to break ground 1,159 feet within the prescribed time. The tunnel is now completed and the work in it reflects great credit upon Mr. McIntyre and his assistants. This tunnel is six and a half feet in hight, 5 feet wide, and has a grade from one end to the other of 40 inches. It is capable of carrying all the waters of Rice creek, in ordinary seasons.

The water, after passing through this tunnel will descend about 100 feet, and empty into a lake in Tehama county known as Tule lake, the surface of which in an ordinary stage of water, covers an area of about 160 acres and is about ten feet deep in the deepest part. This lake the company proposes to use as a reservoir or feeder for their ditch. The water is conducted from Tule lake through a cut in solid lava 660 feet long, 7 feet wide, and 11 feet deep at the deepest point. Of the cost of this cut we are not informed, but being as it is in solid lava rock, can have amounted to no small sum. From this cut the water is conveyed in a flume built on a solid lava foundation, a distance of 924 feet, where it is taken up by the ditch which extends a distance of 15 miles to the head of the pipe. The first six miles of this section of the ditch is on the western slope of the divide ridge between the waters of the North Fork and West Branch of Feather river, the summit of which constitutes the county line between Plumas and Tehama, and which ceases to be a defined ridge at what is known as Deer Creek Pass, on the divide between Butte and Deer Creeks. At six miles the ditch crosses the ridge into Plumas county and follows the side hill to a point on the Stover mountain, overlooking the Big Meadows. With the exception of about two and a half miles at the head of this section ditch the line is in granite rock, which rendered blasting necessary on nearly the whole line. On this work one of DeVolson Wood's steam drills was used, which proved a decided improvement on hand work, doing the work of six men and sinking a hole in hard granite rock at the rate of 22 inches in six minutes. On this section of the ditch both white men and Chinamen were employed, the Chinamen digging and the white men blasting and trimming up the ditch.

The line of pipe connecting with the ditch is a few feet over eight miles in length, and heads at the Stover mountain, passing in an almost direct line to the mountain just north of the upper end of Butte valley. It has a pressure of one hundred and fifty feet, and at a distance of five miles from the head has a depression of 500 feet measured from a grade line. The pipe is made from the best Pennsylvania iron, and was manufactured in Pittsburg for this particular work, and over 600 tons have been used in its construction. The contract for making and laying the pipe was let by the company to E. C. Ross & Co. (Ross, Ragan & Barbour) of Marysville, who erected works on the line for its manufacture, and it is claimed by them that they had in their employ some of the best pipe makers in the State, and from a critical examination of their work we do not doubt the truth of their assertion.

The most indefatigable energy and perseverance has been displayed by the chief head on this work, in its prosecution to an early completion. The whole of the iron used in making the pipe was shipped from Pittsburg by cars to Omaha, thence by the Union Pacific and Central Pacific roads to Chico, thence freighted to Pipetown, where it was manufactured into pipe. As an instance of what can and what has been done in these days of fast freight and machinery, by energy and perseverance such as has been displayed by this enterprise, we are credibly informed that some of the material used in the manufacture of the pipe was taken from the mines in Pennsylvania, made by the Pittsburg foundaries into iron and rolled into sheets, transported across the continent to Chico, and thence hauled by freight teams to Pipetown a distance of 70 miles, manufactured into pipe and laid in the ground in its proper place, all within 60 days.

From the discharge of the North Fork Mining company's pipe a ditch is carried a distance of six miles on the face of the ridge sloping towards Butte valley, the contract for the building of which was let to Ah Shune, of Silver creek, in this county. This enterprising Mongolian has completed his work, and in such a manner as would reflect credit on a master workman of the more favored race. This ditch is six feet wide on the top, and has a uniform depth of three feet. At six miles from the discharge of the pipe the ridge dividing Clear creek from Butte valley is crossed by means of a tunnel, 835 feet in length, and 200 feet below the apex of the hill. This tunnel has been run under contract, by McIntyre & Young, and the work superintended by Mr. John Young, one of the parties to the contract. Hard bed-rock was encountered almost from the very commencement, necessitating blasting nearly the whole length of the tunnel. From the tunnel an old ditch, known as the Ohio creek ditch, is reached by a new ditch one and one-fourth miles in length. This was also built by Chinamen, and the old Ohio creek ditch, which runs to the Dutch hill mines has been enlarged to the capacity of the new ditch leading to it.

To complete the 25¼ miles of ditch and 8 miles of pipe, a large force of men has been employed during the whole summer. The management of the work on the pipe has been under the supervision of Mr. Ragan. That of the ditch has been solely under the control of Mr. Myron Wagner, who is also superintendent of the works at the mines, and too much cannot be said in the praise of this gentleman for the manner in which he has conducted the work.

Refractory Ores Worked Successfully.—Mines were discovered in Flint district, Idaho, says the *Silver State*, several years ago, which at the time created considerable excitement and attracted a great many prospectors and considerable capital. A quartz mill which, it is said, cost $140,000, was built in the district. After numerous trials, all of which proved unsuccessful, the mill was taken down and the machinery sold to different parties. A large lot of it, brought to this county by returning freight teams, found a market in Unionville. This led to the abandonment of the district. Since then another trial has been made, which bids fair to prove successful. The ores of Flint district, as its name implies, consist of hard flinty quartz, carrying a large percentage of base metal. They are very refractory, and cannot be worked by ordinary mill process, as has been proved by experience. Yesterday about four tons of this refractory ore were brought to the Humboldt reduction works to test the efficacy of the roasting process in reducing and amalgamating it. Lot No. 1, containing 1,851 pounds, was sampled, and it assayed $400 per ton. Lot No. 2, containing 6,078 pounds, assayed $350 per ton. No difficulty was experienced in the treatment of either, and the result surprises the owners, who did not expect to realize more than $150 per ton from either lot. As the experiment has proved successful, large quantities of ore from Flint will be brought to the Humboldt reduction works, and the district will again attract the attention of mining men, this time, it is hoped, to work the mines profitably and successfully. The ore is from the Rising Star mine, ten miles south of Silver City.

Roughing it at Panamint.—A letter containing the following items from Panamint was recently received by a gentleman at Reno, Nev.: "There are more men broke here than at Reno. There are about 800 men here, and it is very cold; no lodgings. It is hard to stay here this winter, but I cannot think of returning to Reno at present, as I think by remaining I will succeed. We are obliged to pay $1 for meals, and poor at that. The mines are all located."

The Virtue mine, Oregon, turned out $8,000 recently, from 16 days' run, with 15 stamps.

The Mineral Wealth of California and Nevada.

Notwithstanding the incessant "blowing," which has been kept up by the Pacific coast press during the past quarter of a century, it is safe to assert that no more than one in a thousand of our Atlantic-side friends has formed even an approximate conception of the illimitable mineral wealth of California and Nevada. Independent of the incalculable wealth which yet remains unearthed in the incomparable gold and silver mines of the two States, there are vast and innumerable deposits of other useful minerals, which, without the presence of gold and silver, are capable of enriching an empire. Among the useful minerals which exist in limitless profusion and in gigantic veins and masses in various portions of Northern California and in Middle and Western Nevada, we may mention the great iron mine of Plumas county, California, which Clarence King declared to be one of the heaviest deposits of rich iron ore in the world. Much of this ore is strongly magnetic, and experts assert that it will yield iron fully equal to the best Swedish metal. Not far from the great iron belt of Plumas there exists an enormous mass of black oxide of manganese, which will yield from fifty to eighty per cent. of oxygen. Close at hand there is a large hill, which contains a thick stratum of crystalized quartz, admirably adapted to the manufacture of fine glass, and we shall expect that at some time in the near future, these deposits of oxygen and pure silex will be utilized in the manufacture of plate glass. In Roop county, Nevada, there is a body of land, probably four or five miles in circumference, which is actually covered over with a solid sheet of sulphate of soda. This soda deposit lies immediately under the surface soil. It varies in thickness from eight inches to two feet, and when first exposed to the light is as clear and pure as a sheet of ice. A company of enterprising gentlemen have secured this valuable soda-bed, and propose to utilize it in the manufacture of carbonate of soda. In various portions of both States are to be found extensive veins of steatite, which is the best known substance for the manufacture of fire-bricks. In view of the fact that large quantities of fire-bricks are being annually shipped to this country from Europe, and that the bricks sell for enormous prices when delivered, it is simply amazing that our steatite beds are not profitably utilized. In addition to the useful minerals already mentioned, we have copper enough to supply the world. We have native sulphur enough to supply tophet for ages. We have zinc mines, emery mines, asbestos mines, lead mines, antimony mines, cobalt mines, baryta mines, borax mines, and heavy beds of lignite and bituminous coal. Our marsh lands in many localities are richly impregnated with the alkaline salts, and sometimes contain extensive beds of pure chloride of sodium. Thus it may be readily seen that, notwithstanding the miraculous richness of our mines of silver and gold, California and Nevada can boast of containing a greater variety of the useful metals than can be found in any other equal area of the earth's surface.—*Virginia City Enterprise, Nov.* 25.

A Little Giant Railroad.

The business now being done by the Virginia and Truckee railroad is absolutely immense. The average daily shipment of ore over the road is 1,100 tons. Besides which there is constantly a great rush of merchandise and other freights of every description. Thus the freights received here and at Gold Hill alone, during the twenty-four hours ending yesterday at noon, were as follows: Wood, 29 car-loads; lumber, 21; merchandise, nine; ties, three; machinery, one; fruit, one; coal, two; potatoes, one; steel rails, seven; iron, two. Total, 76 car-loads. But for the excellent management and "eternal vigilance" of H. M. Yerington, general superintendent of the road, its business would soon fall into almost inextricable confusion. The road is doing several kinds of business at one and the same time. It has first to perform the work for which it was specially constructed, namely, to carry supplies of ore from the mines to all the mills at Silver City and on the Carson river, and bring to the mines their supplies of timbers, wood and lumber; but, in the meantime, it must bring all manner of machinery for the mines and mills, haul all of the stone coal used on the Comstock range, bring all the goods of every kind required by our business men, transport live stock for our butchers, and fish, fruit, vegetables, and all kinds of perishable articles for our family markets; carry passengers and the mails with all the regularity and punctuality of the biggest railroad in the Union, and besides doing all this, must be able to furnish excursion trains as often as required, and often at very short notice. All this is done, however, and what seems to the mere looker-on confusion of the wildest kind, all is system of the most perfect and admirable description. All of the whistling and snorting, puffing and blowing, backing and filling, and charging to and fro on side tracks, means business, and in the whole there is design.—*Virginia Enterprise.*

The silver bullion shipments of Professor N. P. Hill, agent for the Boston & Colorado Smelting company, during the week ending November 14th, 1874, consist of 15 bars of which the aggregate coin value is $20,219.74, or a little over $28,300 currency value.

New Discoveries in Inyo County.

We have the pleasure to record, says the Inyo *Independent*, what from all accounts is likely to prove the most valuable and important mining discovery ever made in the county. Indeed Judge Hanson of this place, one of the lucky ones, (and whose judgment is to be relied upon, since he is well acquainted with almost every mine in the county,) thinks the prospect the most flattering ever seen on this coast. It is a discovery made about two weeks since by William and Robert Brown, brothers, in Coso district, about ten miles northeast of the old Coso camp or town. It consists of huge veins or deposits of carbonate lead ore, rich in silver, and of the very best smelting class, as has been demonstrated by actual trial. In amount, so far as surface indications can prove the fact, the ore is simply inexhaustible. The Judge insists upon it that he is not in the least excited, and yet at the same time feels perfectly assured that in less than twelve months from date this new camp will eclipse in the amount of rich bullion it will turn out every other smelting district in this or any other State; and, from what he says of it, we think it extremely probable. The ore, by several assays made at Cerro Gordo and Swansea, yields on the average over seventy ounces in silver and over fifty per cent. lead. The two principal veins are over twenty feet wide, of solid ore. The formation is soft limestone and porphyry, nearly as soft as the ore itself, owing to which fact the country rock has worn away as fast at the ledges or vein matter leaving the latter exposed, when otherwise the more rapid oxidation of the lead contained would have caused the ores in the lapse of years to sink out of sight. Geologically the conditions could not be more favorable, both for permanency and ease of working; tangibly the ore in unlimited quantity is there, plain to be seen, and however extravagant the Judge's opinion may appear to be, we fully believe from his account and our faith in his truthfulness, that his anticipations will, sooner or later, be fully realized, and that this discovery is, in point of fact, the most valuable one yet made in this county. But taking things as they are, material for active work is being sent out as rapidly as possible, the district has been duly organized, its boundaries defined, a set of laws adopted, numerous locations have been made and recorded, and now all who choose can go and see for themselves, and find mines for themselves. It is not at all probable the claims have been taken, for as yet it does not appear that over a dozen persons have ever been in this camp, notwithstanding it forms a portion of the old, by name, well known Coso district. Specimens of the ore can be seen at this office. We cannot at this issue attempt a minute description or account of the ledges or district, but shall do so soon. The district is less than thirty miles south of Cerro Gordo, and full as easy of access, being only six miles east of the Panamint road. Plenty of wood and water is found within available distances, and altogether the new Coso is very favorably located, and on its own merits is going to be *the* camp of all.

Chrome Iron.

One thing is demonstrated beyond question, that there are immense deposits of chrome iron in Sonoma county. It is now being shipped East, and we are informed nets only $1.50 a ton. At the manufactory it is worth from $40 to $60 a ton. Here is a margin for profit. Chromium is extracted from chrome iron stone, named from its tendency to impart useful and beautiful colors. Chromium compounds are used in photography in printing and in dyeing. The brilliant green color used on legal tender notes is a chromic oxide. The same pigment is used in staining glass and painting porcelain. The base of all its combinations is the common yellow chrome of commerce. One of its combinations, a chromic chloride, is said to possess virtue as a remedy for cancer. Witter springs in Lake county may owe its peculiar virtue in cancer to this ingredient in its waters, as it is surrounded by deposits of chrome iron.

Chromium steel is made by combining five per cent. of chromium with cast iron. On account of its excessive hardness it is used in the construction of safes. It has also great tensile strength and is extensively used in the construction of suspension bridges.

We have vast deposits of this valuable metal in Sonoma and the day must come when it will be utilized and made a source of profit and revenue. In the United States the only chrome iron mines worked are in Maryland near Baltimore.—*Sonoma Democrat.*

New Mines.—W. R. Mitchell, an old resident of Paradise valley, says the *Silver State*, discovered a few weeks ago some float quartz on the east side of the West Paradise range, between Provo and Woodman. He had a sample of the float assayed, and found that it contained $13 in silver and $6 in gold. Last week he went to tracing the float, and succeeded in finding a large-sized ledge, or rather a series of ledges a few feet apart. He showed us a specimen of ore taken from one of them which he thinks will assay $100 per ton in silver. It has long been believed that the West Paradise range contained valuable mines, as some stock herders found ore west of Willow Point Station several years ago, which was represented as being very rich in silver. Probably Mr. Mitchell's discovery will induce others to prospect the range, and lead to important mining discoveries in that vicinity.

SCIENTIFIC PROGRESS.

Spectroscopic Revelation and Its Practical Uses.

The spectroscope has enabled chemistry to overleap the barrier which the great philosopher Comte prononnced insurmountable—that of determining the chemical characteristics of heavenly bodies. Comte asserted that we could never learn anything of the planetary contos beyond what related to their geometrical and mechanical properties—the nature of their movements and the forces by which their movements were produced. But the province of chemistry, through the aid of the spectroscope, can be carried even to the farthest space in the heavens, from which the faintest ray of light can reach us.

The light of hundreds of stars has been analyzed and nebulæ, scarcely visible, have had the quality of their radiations revealed by its aid. The light, in some cases proves that the constitution of these stars is like that of our sun. Aldebaran sends us records of hydrogen, magnesium and calcium, which abound in solar light, but also those of metals which are rare or absent, such as tellurium, antimony and mercury.

Nebulæ, 20,000 times less brilliant than a candle at a distance of 13,000 feet, still give a spectrum; for their light, although feeble, is very simple in its construction, and the spectrum which it gives consists only of two or three bright bands, one of hydrogen the other of nitrogen. These nebulæ, which give a spectrum of bright lines, are there in an "abyss" between them and resolvable nebulæ, which, like ordinary stars, give a spectrum with dark lines.

What an effort of the human mind! To discover the constitution of stars of which the distances are unknown; of nebulæ, which are not worlds; to establish a classification of all the stars, and still more to guess their ages. Ah, tell me, is not this a triumph for Science! Yes, we have classed them according to their ages. Stars colored, stars yellow, stars white; the white are the hottest and the youngest; their spectrum is composed of a few lines only, and these lines are dark. Hydrogen predominates. Traces of magnesium are also met with, of iron, and perhaps iodium; and if it is true that Sirius was a red star in the time of the ancients, it owed, perhaps, its tint to the greater abundance of hydrogen at that epoch. Our sun, Aldebaran Arcturus, is among the yellow stars. The colored stars are not so hot and are older. In consequence of their age; they emit more vivid light. In them there is little or no hydrogen. Metallic lines abound, but one also finds channeled spaces, like the lines of compounds. The temperature being lower these latter can exist whether they consist of atoms joined to others of the same kind, or whether they contain groups of heterogeneous atoms.

As to matter it is everywhere the same, and the hydrogen of water we meet with in our sun, in Sirius, and in the nebulæ, everywhere it moves, everywhere it vibrates; and these movements which appear to us inseparable from atoms, are also the origin of all physical and chemical force.

The same wonderful instrument has also been carefully and practically applied to some of the commonest mechanical operations of the day—the refining of the precious metals, and the manufacture and puddling of iron. The use of the spectroscope in determining the changes which are passing in a mass of molten metal, whether in the puddling furnace or in the smelter's crucible, is pronounced one of the most beautiful and reliable expedients in metallurgy, although its full value has not yet been worked out.

Mr. A. McMartin recently stated, at the American Institute of Mining Engineers, that one never tires of watching the brilliant changes in the spectrum as they occur from moment to moment, when it is brought to bear upon molten metal. The specific causes of these changes have been the subject of much dispute and unsatisfactory investigation. But all are agreed that carbon has something to do with them, whether as such, or in gaseous form in such nitrogenous compounds as cyanogen. Whatever be their cause, these changes do take place—and that so regularly, that an experienced eye can place full dependence upon them as indicators of the state of preparation of the metal bath. The spectrum at first appears without lines; but as soon as the spark period begins to give place to its successor, and the clear frame to extend out of the mouth of the converter, the bright orange-yellow sodium line quickly makes its appearance, and remains clearly visible till the blast is turned off. After the sodium line appear the red lines, which represent calcium and lithium; and then a beautiful series of perfectly graded green lines in the green, and pale blue lines in the blue section of the spectrum, manifest themselves, one after another, each in its series, until, at the climax of the operation, when the greatest heat is attained, the spectrum rivals that of chloride of copper in beauty and brilliancy. A very experienced eye can also sometimes see a beautiful violet line in the violet section at this point.

But the characteristic lines of the Bessemer spectrum are the beautiful band-like graduated series, in the blue and especially in the green section. In the inverse order to that in which they arose to their climax, these lines gradually diminish in brilliancy, and at last vanish. But some of the green lines still remain, after the blue series has entirely vanished; and at this point nothing must be allowed to distract the conductor of the operation from closely watching the spectrum; for the only index, though a perfect one, of the exact end of the operation, is the degree of brilliancy of certain green lines, which remain when the charge has arrived at the point of desired decarburisation. For different mixtures of pig iron a difference in the appearance of the indicating green lines is noticeable at this point; and to secure with the same mixture a desired slight difference in the grade of steel produced in two different blows, proper allowance must be made on one or the other side, of a certain degree of brilliancy of the green lines.

The use of the spectrum as an aid to the refining process for gold and silver is now being closely and practically studied at the British mint. The utmost confidence is felt that it will soon be made practical not only for qualitative but also for quantitive analysis.

A NEW ASTEROID DISCOVERED BY PROF WATSON IN CHINA.—The Japan *Gazette* of Nov. 3d furnishes the following interesting item: Prof. James C. Watson, of the Michigan University, America, who has charge of the American Transit of Venus party, located at Pekiug, has had the honor of adding another asteroid to the list already discovered. This makes a total of about 140, and is the seventeenth of these miniature planets which Professor Watson has discovered. But two observers—Peters, of America, and Luther, of Germany—have more credited to them. These planets all take their names from mythology, and as this is a Chinese production Chinese mythology will yield its name. Among the many divinities there is one Neva, whose duty it is to attend to the skies, and mend them, if, by chance, a rent occurs, and whose name would not be inappropriate. The planet was first seen at 8:30 o'clock on the evening of the 10th of October, and is of the eleventh magnitude. Its right ascension on the 10th was 0h. 58m. 01.68s.; its declination, 10° 42′ 52″; on the 16th, 0h. 52m. 46.46s., and 10° 26′ 15″.

NEW METHOD FOR THE COMMERCIAL PREPARATION OF OXYGEN.—Mr. J. A. Wanklyn, of London, observing that copper oxide gave up easily its oxygen to barium oxide to produce barium peroxide, proposes to utilize this property in connection with the fact that metallic copper when highly heated, becomes oxidized to copper oxide, for the economical preparation of oxygen from atmospheric air. The barium oxide is mixed with at least half its weight of copper oxide, placed in an iron retort and heated to redness, a jet of steam being blown in. The barium peroxide at first formed gives up its oxygen, and becomes oxide again. Atmospheric air is then blown into the retort, (the steam being stopped) which again, through the mediation of the copper oxide, oxidizes the baryta to peroxide. This is then decomposed by steam, as before. Instead of baryta, caustic lime or manganic oxide may be used, or a mixture of the latter with lime or baryta.

NOVEL ENGINE ATTACHMENT.—The Corliss pumping engine, for the Providence water works, is a marvel of automatic self-regulation. The problem of dispensing with a second reservoir or stand-pipe for high service, the Corliss company has solved, by the construction of a unique "table engine," capable of pumping 5,000,000 gallons of water per diem, or more if needed. This is to say that, if every outlet from the supply pipes distributed over the high service of the city were closed so entirely that no water whatever escaped, the pumping apparatus remains perfectly at rest, but the instant any appreciable outflow occurs, the machinery, with no human eye intervening, proceeds to supply the waste. It has been known to be over five and a half minutes in making a single revolution, moving regularly all this time, however, and capable of increasing the rate almost immediately to more than 30 revolutions a minute—and all that of its own accord.

ACTION OF AMMONIA ON SUGAR.—On employing absolutely dry sugar, and subsmitting it to the action of a current of ammoniacal gas, dried over a long column of quick-lime, the sugar becomes at first opalescent, and takes the waxy consistence described by Raspail, but in the course of twelve hours, says Laborde, it liquefies, and flows on the surface of the tube in which it is contained; 100 parts of sugar absorb 7.83 of ammonia. On exposure to the air, the sugar loses the ammonia which it had absorbed. At the end of three months the sugar retains only about 0.37 per cent., and has still a very pungent flavor. Glucose similarly treated liquefies very rapidly, becoming colored, and forming a crystalline product.

A NEW EXPLOSIVE.—A series of highly interesting and successful experiments with a new explosive have taken place at Minerva, near Wrexham, Wales. Nearly 500 civil engineers and others interested in mining operations, were present. The new powder, which has not yet been patented, is the invention of Messrs. Curtis & Harvey, the well known gunpowder manufacturers, and among the special advantages claimed for it are that its explosive force is exceptionally great; that it throws off very little smoke or injurious gas; and that it is quite as safe for use as ordinary powder, not being liable to explode by increased temperature, exposure to the sun, percussion or self-ignition.

NOVEL SCIENTIFIC CLASSIFICATION.—J. H. Stenson, of Jacksonville, Oregon, proposes to set before the world a new system of classification for all natural phenomena. It is applicable to all the natural sciences. It proceeds by inductive methods, which are new, and works complete formula for that purpose. By these it brings out the causes involved in any set of phenomena. The system can be used in the wheat field, in the garden, in the dissecting room, and throughout nature. It is a scheme by which results can be calculated in a manner similar to the plan upon which the surveyor acts, when after getting his data, he proceeds to determine the area of the land. The idea was some months since explained by the author to the Agassiz Scientific Institute at Sacramento, at which Rev. Mr. Bonte expressed the opinion that there were merits in the idea, and explained at some length how it would be useful to the world. Dr. Logan also said the subject and its treatment were entirely new, and worthy of serious consideration and investigation.

PRIZES FOR ESSAYS.—The Academy of Arts, Science and Belles Lettres, of Caen, France, offers a prize of eight hundred dollars for an essay on the subject of the functions of leaves in the vegetation of plants. A dissertation on the present state of science on this question, including the results of personal experiment, showing new facts tending to confirm or modify the doubtful points in theories now admitted, is required. The papers must be submitted before January 1, 1876.

Another prize, of one hundred dollars, is offered by the Academy of Sciences of Rouen, for a treatise on the advantages to be obtained by the conservation and improvement of cider by the employment of the processes of heating now applied to wines. The award will be made during the coming year.

MR. STANLEY has been heard from, and in a manner to afford much pleasure and hope to those interested in geographical discoveries. It is understood that he will take up the work left unfinished by Dr. Livingstone, and he gives a very satisfactory account thus far, of his labors. He is satisfied, from actual survey of the Refugi river, that it has two mouths. This is the route taken by slave traders, and Stanley proposes that light-draught boats, carrying steel guns, shall be stationed in the river, as more effective in putting a stop to the traffic than cruisers along the coast. He has established a supply station on the delta, and will proceed vigorously with his work of further explorations.

MECHANICAL PROGRESS.

The Inventor of the Screw Propeller.

Americans, English, French, Germans and Italians all claim this invention, and that not for an individual of each nation; but in some countries more than one of their sons, dispute the honor of being its inventor; and probably experiments to discover the means of applying the screw as a motive power to ships were at different periods spontaneous, independently, and sometimes spontaneously made in various places by inquiring minds, who were perfect strangers to each other and to each other's discoveries and appliances.

So far back as 1726, David Bushnell, a native of England's American Colonies, made experiments by means of a screw to propel a submarine torpedo. Evidently his essays were not successful, or those infernal machines would have been heard of sooner. In 1836, John Smith, an Englishman, formed a company and built the first sea-going screw steamer, appropriately named the Archimedes, from which date the ancess of the screw propeller was an accomplished fact. Between 1726 and 1836, many inventors took the matter up, but it was not until 1832 that one of the experimentalists, Frederic Sanvage, hit upon the idea of applying steam to the screw as a motive power. Up to that period it had been sought to drive the screw by a capstan manned by men, or other cumbrous non-practical means. In France, Frederic Sanvage is considered to have the largest share of merit in practically applying a machine which is the production of many minds, and which even now is being continually improved.

The town of Boulogne-sur-Mer, where Frederic Sanvage was born on the 20th of September, 1786, has lately gone to considerable expense in awarding him posthumous honors, which on Monday culminated in the unveiling of a monument to his memory.

EXPERIMENTAL PAPER MAKING.—At the recent Vienna Exhibition there were some specimens of paper made from several materials which have not hitherto been utilized for that purpose. Among these was paper from the mulberry-tree bark, from the stinging-nettle, and from potato stalks. In districts of European countries where mulberry trees are used for feeding silk-worms the remaining twigs have served only for fuel. But now, in Austria and parts of Italy, the bark is peeled off by a simple arrangement, and from it a material prepared from which a good quality of paper is made. In Hungary the nettle is used with rags for making fine sketching and copying paper, and in Bohemia wrapping paper is made from potato stalks.

GLASS-LINED TANKS AND CISTERNS.—Mr. Hartley, a brewer of Orminsk, has suggested an idea which may solve a difficulty felt in many trades. He proposes the use of a lining of glass to the vats employed for the fermentation of liquors, and has patented a means for attaching plates of glass to iron or other materials commonly used for the construction of such vats. The idea arose from his own requirements, as there is considerable difficulty experienced in perfectly cleansing wood, stone, or slate from the germs of organisms which accompany or induce putrefaction. With glass there is no such difficulty, and especially where no elevation of temperature is necessary this device of Mr. Hartley's appears to be satisfactory. The strength necessary to contain large bulks of liquid is of course given by the wood or iron basis of the vessel, while cleanliness is secured by the lining, which in many cases may be ordinary window glass, and in none exceed three-eighths of an inch in thickness. Although primarily intended for the use of brewers, we do not see why the use of glass linings should not be extended, and it is likely to prove very valuable for house cisterns, as besides being more cleanly, a wooden cistern, glass-lined, would probably cost much less than a zinc or leaden one, and offer no chance of corrosion or contamination.

A NEW STREET CAR.—A citizen of Cincinnati has put upon the streets of that town a vehicle designed to supersede street cars. It is about the size of a common street car, and will seat sixteen passengers. The wheels are similar to those on carriages, but the axle is carved in such a manner as to allow the floor of the car to be on a level with the pavement. The driver sits in front, and uses an ordinary foot brake in place of those common to street cars. The entrance for the passengers is peculiar. The steps are parallel with the side of the car, but the doorways, one on each side, are placed diagonally across the end. This arrangement is made to allow passengers to step directly into the car from the sidewalk. It is said that these cars cost less than others in use, require no track to be laid down, and, owing to the double action of the wheels, run as lightly and easily as buggies of modern improved patterns and constructions. These cars or vehicles may take the place of omnibuses No doubt they will, if properly introduced, but they will not supersede passenger railway cars.—*Chicago Inter-Ocean.*

PETROLEUM OIL FOR DRESSING LEATHER.—Petroleum oils are coming into use for dressing leather, and their use for this purpose is largely increasing. The use of petroleum oils for leather dressing is protected by several patents, issued at different times to R. H. Lightfoot, and now controlled by the Meriam & Morgan Paraffine company, of Cleveland, Ohio. Mr. Lightfoot claims that by the use of petroleum many advantages are gained, among which are: that the leather can be reduced to the desired pliable condition more rapidly and with less cost than with pure animal oils; that the coloring of tanned leather is effected more rapidly and thoroughly than by the old process, and that the finished product is superior, both in pliability and toughness, to leather tanned and curried by the use of pure animal oils. The heavier gravities of petroleum, such as paraffine and steam reduced oils, are the only ones used in this way, and the general introduction of these oils all over the country for these uses, seems to be only a matter of a short time.

DANISH IMPROVEMENT IN BALLOONING.—The Danes, too, it seems, have got the balloon fever. It appears that Sivel, a celebrated Danish aeronaut, made an ascent and crossed the Sound into Sweden for the sixth time this year. *Galignani* says that Sivel has no fear whatever of alighting in the sea, as he has invented a little safety apparatus which would have been of great service to his French colleagues. He drops into the sea a sort of canvass cylinder, of a conical form, and held by a guide-rope to the car. It fills with water and is kept down by the weight of the liquid. He then throws out a little ballast and the balloon arises, but is retained like a captive only a short distance above the sea. He can thus wait until a vessel comes to deliver him or until he drifts ashore. Should he wish to rise again, he pulls a cord attached to the point of the cone and which turns it upside down. The water escapes and the balloon is freed. The invention has been tried by him over twenty times at sea with perfect success.

AMERICAN MECHANICAL PROGRESS.—An English ironmaster from Clyde, Scotland, recently visited this country and made a tour through the Western States. At Chicago he saw sixteen car axles made by one steam hammer in one day. He had heard that we could make double as many axles in a day as they could in England, but always thought it was "Yankee blow." Now he "acknowledges the corn," and says eight axles per day is the number usually made in England with one hammer. He further says that all our shafting and forging is done cheaper than in England. He visited several of the Pittsburg works, and at Wm. Miller's he was again surprised to find that fourteen to sixteen per day could be made with one hammer. He was convinced that the main cause of this was the superiority of our machinery, and the fact that we use a blast for our furnaces instead of a draft, as is generally used in England.

Mining Stocks.

The mining stock market has been in a state of great excitement during the past week, caused by the recent wonderful developments on the Comstock lode. Of course developments like these would put stocks up in spite of anything. The old Comstock lode, which has always been considered a wonder, will make itself even more famous; if we believe only half of the stories of the new strikes, there is still something unparalleled in the history of mining on this coast or anywhere else. All this is good for California, as the Comstock is owned principally by citizens of this State, who invest their earnings here.

The excitement on the streets here with regard to the developments and prices of stocks has been intense. California street has been crowded with anxious speculators all eager to get hold of some of the "good things." Of conrse, California, Consolidated Virginia and Ophir have been the favorites. No one seems to take any notice of the long list of assessments levied this week, though the million dollars to be disbursed as dividends next week will more than compensate for them. California and Ophir ought now to be added to the list of dividend paying mines, and if reports are true should pay larger dividends than even Belcher and Crown Point.

The Ophir compsny have divided their ground and given 600 feet to the Mexican company, Ophir shareholders receiving shsres in the Mexican pro rata to the number now held. Ophir now has 675 feet, and Mexican 600 feet. Both companies have a capital of $10,080,000 in 100,800 shares.

The developments at the north end of the Comstock have affected the prices of all the stocks on the line as a matter of course. How long the present excitement will contine it is impossible to tell, but it will probably occur sgain as soon as a new strike is made.

Sales at the S. F. Stock Exchange.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco.

MAVEL S. M. Co.—Dec. 4. Location: Panamint District, Inyo county, Cal. Capital stock, $6,000,000. Directors—Jas. A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and J. McGillivray.

ALICE S. M. Co.—Dec. 4. Location: Panamint District, Inyo county, Cal. Capital stock, $6,000,000. Directors—Jas. A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and J. McGillivray.

STAR S. M. Co.—Dec. 4. Location: Panamint District, Inyo county, Cal. Capital stock, $6,000,000. Directors—Jas. A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and J. McGillivray.

WYOMING CON. S. M. Co —Dec. 4. Location: Panamint District, Inyo county, Cal. Capital stock, $6,000,000. Directors—Jas. A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and J. McGillivray.

DELAWARE S. M. Co.—Dec. 4. Locatiou: Panamint District, Inyo county, Cal. Capital stock, $6,000,000. Directors—Jas. A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and J. McGillivray.

JULIA S. M. Co.—Dec. 4. Location. Panamint Mining District, Inyo county, Cal. Capital stock, $6,000,000. Directors—Jas. D. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and J. McGillivray.

OARIBOU S. M. Co.—Dec. 4. Location; Panamint District, Inyo county, Cal. Capital stock, $6,000,000. Directors—Jas. A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and J. McGillivray.

WONDOR CON. M. Co.—Dec. 4. Location: Panamint District, Inyo county, Cal. Capital stock, $6,000,000. Directors—Jas, A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and J. McGillivray.

PANAMINT WAGON AND TOLL ROAD Co.—Dec. 4. Object: To construct, conduct and maintain a wagon road and toll road in Panamint Mining District, Inyo county. Directors—James A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond, and Jos. McGillivray. Capital stock, $200,000.

OARIBOU HYDRAULIO M. Co.—Dec. 4. Location: Plumas county. Capital stock, $2,500,000. Directors—Henry Merwin, Ira E. Oatman, Chas. W. Reed, John Miller, and A. N. Towne.

GREENWOOD G. M. Co.—Dec. 7. Location: Greenwood District, Mohave county, Arizona. Directors—Jas. A. Pritchard, Robert Steen, S. A. Raymond, W. E. Hall and Joseph McGillivray. Capital stock, $2,500,000.

MEXICAN G. AND S. M. Co.—Dec. 7. Location: Comstock Lode. Directors—J. D. Fry, James A. Pritchard, James H. Robinson, James Frecborn, and A. K. P. Harmon. Capital stock, $10,080,000.

CEDAR VALLEY G. M. Co.—Deo. 7. Location: Mohave county, Arizona Territory. Directors—James A. Pritchard, Robert Steer, S. A. Raymond, W. E. Hale and Joseph McGillivray. Capital stock, $2,600,000.

SUSCOL WATER Co.—Dec. 8. Object: To acquire, appropriate and take up all the waters of that certain stream situated on the lands of Julius O. McCeney, known as the Saucol or Morrisania farm, in Napa county, together with the waters of all tributaries or branches that flow into it; to conduct and convey the same, by means of reservoirs, canals, ditches, pipes and other conduits, for the purpose of furnishing and supplying cities and towns of the counties of Napa and Solano with fresh water. Directors—C. W. Lightner, Tiburcio Parrott, James Frecborn, Robert M. Welch and Julius C. McCeney. Capital stock, $500,000, divided into 6,000 sharea.

PIGEON POINT AND PESCADERO RAILROAD Co.—Dec. 8. Object: To build and control a narrow gauge railroad from high water mark at the Pigeon Point Landing, to the town of Pescadero, in San Mateo county. Directors—Charles Goodall, John O'Farrell, Christopher Nelson, Joaiah P. Ames and James Byrnes. Capital stock, $70,000, divided into 7,000 shares.

RICHMOND G. M. Co.—Dec. 8. Location: Railroad Flat Mining District, Calaveras county, California. Directors—Gerge O. Davis, George W. Cope, O. Embody, Victor David and Wm. T. Rohinson.

The following companies have filed certificates of incorporation in the office of the Secretary of State, at Sacramento:

OARIEOO HYDRAULIO M. Co.—Location: Monterey county. Capital, $2,500,000, in shares of $25 each. Directors—Henry Merwin, Ira E. Oatman, Charles W. Reed, John Miller and A. N. Towne. The principal place of business will ba in San Franeisco.

MONTEREY COAL M. Co.—Location: Monterey county. Capital, $1,800,000, in abares of $100 each. Directors—H. V. Sargent, Gaorge H. Harris, H. Esoolle, Reuben Morey and Lewis Little. The principal place of huainess will he in Monterey.

AMERICAN MILL AND METALLURGICAL Co.—Capital, $10,000,000, in shares of $100 each. Directors—John F. Miller, Noble Hamilton, Louis Sloas, O. C. Miller and Louis Patchen.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALAMEDA COUNTY.

SUNOL VALLEY.—Cor. Livermore *Enterprise*: Several parties have been in this section prospecting for minerals. Six or seven coal discoveries have been made, and it is hoped that the owners will push their work ahead until a paying coal mine is opened. The resources of this valley are just being brought into notice.

AMADOR COUNTY.

MINING AT VOLCANO.—Amador *Ledger*, Dec. 6: Since the incoming of a supply of water, mining operations in and about Volcano have been very active, and a very large amount of gold will be taken from placer claims during the run of water.

Young & Co. are running three hydraulics in their claims on Union Flat, with a splendid body of gravel known to be rich in gold. On the McComber claim, one hydranlic is at work on a fine body of pay gravel.

McCreary & Co., on Indian gulch, have long been engaged in running a tunnel, so as to obtain a tail race from the heavy deposits of pay gravel lying in the hill; the tunnel has very recently been completed, and hydraulicing commenced on last Saturday. The claims of the company now presents a face of forty feet in depth of pay gravel, and when they advance further in the hill, the depth will be ninety feet, and what is better still this vast deposit of gravel shows gold from the surface to the bed rock.

CALAVERAS COUNTY.

BIG CLEAN-UP.—Calaveras *Chronicle*, Dec. 6: Veith & Co., the Tunnel Ridge despoilers, cleaned up about $3,000 this week, the proceeds of a short run. The amount yielded is large when it is considered that a good portion of the time included in the "run" they were engaged in "stripping off" top dirt. Another clean-up will be made about the first of January.

MINING AT CENTRAL HILL.—Gravel mining operations at Central Hill and vicinity are exceedingly lively. Work is progressing in a number of claims with the most encouraging result. Machinery—steam-power—has recently been put upon the mine belonging to Judge J. P. Shear. The shaft, the objective point of which is the famous "blue lead," has reached the depth of 80 feet, and levels are started. Gravel of fabnlous richness is being taken from the old Mullen claim. From a dollar up to three onnces is obtained from a single pan of dirt. Nothing like it has been seen since the palmy days of '49 and '50. The lead is wide. Martin & Prindle, proprietors of the Worth's Hill hydraulic, are washing away with their customary vigor. The claim is one of the most extensive in the county, is worked on a large scale and well managed. The enterprise is proving a profitable one to its projectors.

Robinson & Co., at the head of Indian gulch, during the past summer have drifted out a large amount of valuable pay dirt, which they are now washing up.

Work has been renewed upon the Golden Gate and Confidence quartz mines, near Volcano. Both of those mines have produced very rich rock, and no reason can be assigned why there should not be more.

The Rodgers' quartz mine is turning out richer rock, as a body, than at any former time. 94 tons of rock taken from this mine, produced by mill process $2,800, and the ore now being taken out will return a still better result.

WEST POINT DISTRICT.—G. Eberbardt crushed a lot of ore lately which yielded $70 per ton. Zacatero continues to look promising. A contract was let to sink the Mina Rica main shaft 50 feet deeper, or 178 feet in all. The mill is uearing completion. Good Faith tunnel is getting into better ground. Haskins & Co. are crushing about 45 tons of ore, which is expected to realize in the neighborhood of $9,000.

EL DORADO COUNTY.

HYDRAULIC PREPARATIONS.—*Mountain Democrat*, Dec. 5: C. B. Brown has been manufacturing for the Carrie Hale claim, Henry's Diggins, 500 feet of 14-inch, 500 feet of 11-inch and 1,000 feet of 7-inch sheet iron pipe.

A MODEL MINE.—Robinson, at his fine mine on Prospect Flat, has just put in position and last Saturday started up a new ten-inch cylinder steam engine recently constructed for him at Morey's foundry, this city. This makes five steam engines now in operation at the Robinson mine—one 10-inch, one eight-inch, one six-inch, and a small pumping engine. And all of them are operated with the regularity and precision of clock-work, and with the nicest possible regard to economical and profitable management. Without the slightest fear of successful contradiction, we will venture the assertion that there is not in California a better opened or better managed mine than Robinson's at Prospect Flat, nor one which is more regular in rich yield of the most precious of metals.

OIL STONE.—We saw a fine speoimen of oilstone a few days since, taken from a mining shaft near the city. The indications are that there is an extensive solid ledge of it, and it is believed that it can be worked at great profit.

MARIPOSA COUNTY.

LEASE OF A MINE.—Mariposa *Gazette*, Dec. 5: The property owned by the Maxwell's creek

mining company has been leased to another company and work thereon will soon commence. This mine and mill was formerly owned by a French company, and is situated about a mile from Coultervills.

Pool Mining Co.—This mining property is less than two miles from the town of Hornitos, and embraces five distinct gold bearing lodes of quartz. Some of these have been held by Mr. Pool and others, and occasionally worked, though at a disadvantage, for twenty years or more—the parties working having to haul the quartz seven or eight miles to mill it. There is a good water privilege connected with the property, sufficient to run an eight-stamp mill from six to nine months a year. The capital stock of the company only represents $10,000. It should be taken up at once by practical men and the property developed. There is money in it, but it won't jump out of the ground ready coined. We believe it could be made one of the best paying mines in Mariposa county.

NAPA COUNTY.

Calistoga Silver Mine.—St Helena *Star*: We were most favorably pre-possessed with the appearance of the ledge standing like a "true fissure" almost perpendicular, bound in by solid foot and hanging walls, with a pitch of about eighty degrees. Passing by a dump of some five hundred tons of argentiferous rock, all high grade, a lump of which exhibited the native wire or horn silver, we arrived at the mouth of the lowest level, where we found a number of men selecting choice rock for the stamps. Many tons of this rock had already been collected and was only awaiting its chance to go to the mill.

Mork Mercury.—Messrs. Mayers & Cook have discovered a fine ledge of quicksilver on the land of Mr. Loui Bruck, of Napa. The rock is of the same quality and bears the same oxide as the Phœnix mine. It is six miles a little east of north from St. Helena.

NEVADA COUNTY.

Omaha Mine.—Grass Valley *Union*, Dec. 8: This mine seems to be progressing very favorably. We saw some very fine rock which came out of the mine last Saturday. The ledge is nearly two feet thick, and shows well in free gold, besides giving a generally healthy character of rock.

Idaho.—Foothill *Tidings*, Dec. 5: A trip to the Idaho mine once in a while is a good thing to take, as an offset to the talk of the croakers one finds here every day in the week. The busy hum of industry pervades everything thereabouts, and everybody is too much occupied to think of hard times or that they have any place in Grass Valley. Another such an enterprise as the Idaho here, with the many smaller ones always contributing something to business, would make times as lively here as they ever have been. When the Allison ranch mine starts up again, as we are assured it must at no distant day, it may soon be on a par with the Idaho, both in the number of men worked and the amount of gold produced. So, too, of the Rocky Bar claims, when consolidated and worked. It is not too much to expect to see both these properties working, and on the big plan, within the next year.

Eureka.—Hoisting and crushing still continue at the Eureka, and though they have no regular winter stock of wood on hand purchases are made in quantities needed, and no sign of let up yet. Good buildings have been put up over the hoisting machinery at No. 2 shaft since we were out before, and that begins to look quite like a mine. The clean-up of the past six days' run of ten stamps is 420 ounces of amalgam.

At Gaston ridge the California mine is working with good prospects of complete success. They have their new ten-stamp mill nearly completed, and will be ready to run in a week or ten days. They are said to have a fine lot of ore out and a large ledge opened up which will average well. Our informant thinks there are hundreds of tons of tailings of the old mill that burned down several years ago that would pay well.

The Liberty mine, near Eureka, in this county, seems to be going right ahead, under its new ownership and management. A new steam hoisting works has lately been put up and will soon be ready to run. Their mill is run by water power, we believe, and the works will soon be doing duty, with a good mine to back them with ore.

PLACER COUNTY.

Mining Prospects.—Placer *Argus*, Dec. 5: Work is being prosecuted vigorously on the quartz mines in this vicinity.

Orleans—Extensive improvements are contemplated by the Booth company. Ore of excellent quality is coming out in large quantities, and the prospects of the mine never were better.

St. Patrick.—The Crater Hill mine is rapidly regaining its old reputation. The character of the developments warrants the belief that the mine will yet prove valuable to its owners.

Hydraulic Mining.—Several claims have already begun working and others are only waiting for a good supply of water. The Iowa Hill canal company will be able to furnish several thousand inches of water, and a large tract of very rich ground heretofore but imperfectly worked, will, therefore, be thoroughly mined. At Todd's valley, Yankee Jim's, and in fact, all through the mining camps of that divide, the preparations for work have been extensive, and the prospects are of the best. The Dutch Flat tunnel was so far completed early in the summer that washing on one claim began, but a scarcity of water limited the extent of their operations. There will soon be all the water that is needed, and we may look for rich clean-ups.

Copper.—It is well known by all old settlers that rich copper lodes abound throughout this section of country. All that is needed to revive the copper mining excitement is the procuring of apparatus that will successfully work the ore and save the copper. The only mine being worked at present, so far as we know, is at Spencerville in Nevada county. The ledge on this mine is about 70 feet thick. The success in working the ore from this mine so far has been quite encouraging. We hope it may continue so for there are many other mines in this vicinity, both on the other side of Bear river, in Nevada county, and on this side, in Placer county, equally as rich, that are awaiting the established success of this one.

PLUMAS COUNTY.

Mining Items.—Plumas *National*, Nov. 28: The superintendent of the East Branch ditch expects to have water running through the ditch to Shoo Fly by the last of next week. The Green Mountain mine, between Crescent and Cherokee, has shut down for the present, the roads being so soft that teams cannot haul rock. The Genessee mine is being worked steadily and paying well. Compton is taking out $50 rock from the Baker mine, and the ledge looks firstrate. Trelevan & Co. are taking out some good rock from the Pennsylvania mine. Garland has stopped work on his Lava Bed claims until after New-years. He is getting some firstrate pay. The Indian Valley mine is turning out some good paying rock. Gregg is taking 100 tons of rock from the Grass ledge, for crushing.

La Ponte Items.—*National*, Dec. 5: Couley & Gowel have a good head of water, and are running gravel very lively, working two monitors day and night. Gard & Orr are also at work at the head of Rabbit creek, with two monitors. They have prospects ahead for a big clean-up in the spring. The Spanish Flat company, Wm. Taylor, superintendent, is hard at work on Spanish Flat, with one monitor. The prospects are flattering. The La Porte Gravel and Water Mining company, located at Secret Diggings, was not ready for water before the storms commenced, consequently, they are not running their monitors. The Claybank Mining company are running ahead in their main tunnel, which is now in 1900 feet. They have been working to considerable disadvantage on account of bad air, but have now overcome that difficulty. They have eighteen inches of as fine looking gravel as they could wish for, and there is a very good sprinkling of gold mixed with the gravel. They will, no doubt, be taking out pay dirt in a short time.

SIERRA COUNTY.

Mining.—*Mountain Messenger*, Dec. 5: Shafer & Garabaldi are putting pipe in place with which to hydraulic the red bank north of town. This ground was worked many years since, during flush times, when miners did not work as closely and carefully as they do now, and it is probable that good pay may be obtained in the tailings.

Scales Diggings.—Correspondence *Messenger:* The miners have got about ready for work. The Boyce Bros.' claim, Fair Play, is under headway. This is one of the principal mines here, and the owners are sparing neither time nor money in keeping it such. Last week one of the powder drifts, ran into a 200 feet bank, was fired with grand results. This blast contained 200 kegs of powder. The gravel in this locality is so solid that the owners found it profitable to blast it before turning on their monitors. Connected with these diggings are two as fine reservoirs as can be found in the country. The upper one when completed will be a creditable affair. The ground was well selected, being a natural basin, only lacking a fourth side. This bank, at the lower end, is composed entirely of earth, will be 30 feet high and 600 across the race. This wall will back the water up from about 1,600 to 2,000 feet. The lower one is not quite so large as the upper, although it is being repaired and enlarged as fast as the weather will allow. The necessary ditch and flume carry the water from these reservoirs to the diggings. The hundreds of feet of pipe laid down in the claim of Mr. Williams show that he too is not idle. They are situated just below the business part of town, and even while I write the roar of his monitors can be distinctly heard. The Union Hill boys are busily piping. A 103 keg blast was fired by them about a week ago. Kingdom Bros., of Poverty Hill, are at work, using about 800 inches of water.

TRINITY COUNTY.

Practical Results.—*Journal*, Dec. 5: Four tanks of quicksilver arrived here this week from Lytle's mine, in Cinnabar district, and consigned to Trotter & Smiley, Douglas City. From Wm. S. Lowden, who lately returned from Cinnabar, we learn that prospects are every day improving and there can no longer be a doubt that Trinity county has the richest cinnabar deposit in the world. Large quantities of quicksilver will be produced there next spring and summer.

Miners throughout the county are now at work, but water is not plenty as yet. The ground is thoroughly soaked, and only a little rain will start the water.

TUOLUMNE COUNTY.

Hydraulic Mining.—*Union Democrat*, Dec. 5: The gravel mine at Marlow, near Summerville, owned by James Burns and Wm. C. Connolly, is nearly ready for working. It is quite extensive, and when the hydraulic is started will return the proprietors handsome pay unless all signs fail. When worked last year it proved excellent ground while water lasted.

Alabama Claim. — Work has been commenced on the River or Alabama quartz claim near Jamestown, by a San Francisco capitalist, who has bonded the claim. Shafts and levels will be run to thoroughly open it, the party having ample means and intends to fully explore the vein. Years gone by the old owners worked it a long time with good success. With the late appliances, patience and money there is good reason for believing it will develop into profitable mine.

Golden Gate.—*Independent*, Dec. 6: Looks better as sinking proceeds, and the sulphurets prospect richer. The shaft is now 85 feet below the tunnel level or 210 feet from the surface, with a lode five feet thick. Last month 185 sacks (over nine tons) of sulphurets were shipped below for reduction. It will be necessary to erect hoisting works soon, and it is in contemplation to add ten stamps more to the mill in the spring.

Rich Ore.—Three tons of ore shipped from the Soulsby mine to San Francisco this week, will go $400 per ton.

Nevada.

WASHOE DISTRICT.

California.—Gold Hill *News*, Dec. 3: The north drift on the 1,500-ft. level connected last Friday with the south drift on the same level from the Ophir, thoroughly ventilating the mine to that depth. Cross-cuts have been commenced on both the 1400 and 1500-foot levels to prospect the ore vein, on both of which levels the ore body will be reached in a very few days. The east cross-cut on the south line, from the Cons. Virginia shaft, has cut and penetrated the ore body a distance of twenty feet. This ore in richness baffles description.

Ophir.—Daily yield 240 tons of ore. Four mills are now crushing ore from this mine, and the yield for this month must necessarily be greatly increased. The ore breasts extending from the 1300 down to the 1400-foot level are yielding splendidly. The 1200-foot winze, sunk from cross-cut No. 3 on the ore body, extending down to the 1465-foot level made connection last Saturday with the east cross-cut on that level, greatly benefiting the air circulation of the mine. To this circulation has also been added the connection of the south drift on the 1465 foot level with the north drift from the Cons. Virginia give a strong draft of pure air, cooling of the levels, and making the mine down to the 1465-foot level, one of the most comfortable to work in on the line of the Comstock. The cross-cut at the bottom of the south winze on the south line is in rich ore, and proves the extension of the ore body downward, and leaves but little doubt that when cross-cutting on the 1700-foot level is commenced, the same rich ores will also be found.

Belcher.—Daily yield, 450 tons of ore. The ore breasts throughout the entire mine are looking well and yielding the usual amount of good ore. The new air shaft is down 83 feet in good sinking ground, and is being pushed ahead with all the vigor possible. An up-raise has been started from the 850-foot level to connect with the shaft.

Caledonia.—A winze is being sunk from the 900 to the 1000-foot level. This winze is situated north and east of the shaft, and is down 70 feet. A drift has been run on the 1000-foot level past the point where this winze will intersect it, and a drift is now being continued on the ore vein from that point.

Consolidated Virginia.—Daily yield, 400 tons of ore. The ore-breasts on the 1300 and 1400-foot levels are yielding the usual amount of rich ore, with no signs whatever of giving out. The development of the ore bodies north on both of these levels is pressing close to the California line, and there seems no longer a doubt but that the same rich body of ore will be found on the corresponding levels of that mine. The east cross-cuts, Nos. 1 and 2, on the 1500-foot level, are still carried forward to the eastward, in an apparently limitless body of the richest possible description of ore. No east wall has yet been reached in either of these cross-cuts.

Sierra Nevada.—Sinking the new shaft is making slow progress. The pumps are kept steadily at work, and a young river of water kept flowing from the shaft. The east cross-cut in the Sacramento ground has penetrated a fine body of quartz, with spots of good ore intermixed. The ore body in the north drift from the old Sierra Nevada tunnel is yielding fine ore, and gives promise of a lasting development. The ore breasts in the old upper workings are yielding 65 tons of ore per day. The mill is kept steadily running on ore from the mine, and the future continues to look bright and prosperous.

Hale & Norcross.—The cross-drifts on the 2000-foot level are still pushed vigorously ahead, without any valuable ore developments during the week, notwithstanding which the indications are sufficiently encouraging to warrant a continuation of the explorations in that portion of the mine.

Julia.—The new pumping machinery is working splendidly. The water in the shaft has been drained. The main drifts are all cleaned out and repaired on the 1000-foot level, and preparations are now being made for some thorough prospecting on that level.

Lady Bryan.—Sinking the main shaft is making fair progress, notwithstanding the steady flow of water, which is easily handled by the pump. The ground is quite soft in the bottom.

Crown Point.—Daily yield, 500 tons of ore. The ore breasts on the 1400 and 1500-foot levels are all looking well and yielding splendidly. In fact, the mine is yielding well at all points. The main east drift at the 1600-foot station is still pushed vigorously ahead to cut and prospect the ore vein on that level. The mills are all in good running order, and future prospects of the mine are looking quite favorable.

Phil. Sheridan.—The indications are good for soon cutting the ledge, at a depth of 600 feet below the tunnel of the old upper workings.

Utah.—Prospecting the ore vein north and south on the 400-foot level is still pushed vigorously ahead. Some very promising spots and streaks of gold ore have been found.

Sutro Tunnel.—The present rate of progress in the header is about 10 feet per day, the Burleigh drills operating with splendid success and execution.

American Flat.—The prospects of this mine are quite favorable, and whenever the new pumping machinery is once in, the prospecting will be driven ahead.

Yellow Jacket.—Sinking the main incline is making good headway, notwithstanding the extreme hardness of the rock penetrated.

Baltimore Consolidated.—Some very promising streaks of ore were found in the east cross-cut on the 750-foot level last Saturday. Almost at the same time a strong flow of water was encountered which stopped the progress of the work. The prospects are quite favorable for an ore development in that portion of the mine when work is again resumed.

Dayton.—Daily yield, 65 tons of ore. The ore breasts on the station level are yielding finely, as are also those on the third level. The ore breasts going south on the third level are looking remarkably well.

Imperial-Empire.—The main east drift on the 2000-foot level is still driven steadily onward to connect with the south winze from the level above, as soon as that air connection is completed, cross-cutting the ore vein will be commenced.

Chollar-Potosi.—Daily yield, 45 tons of ore the assay value of which is $27 per ton. Cross-cutting and prospecting at the fifth station level, is still vigorously prosecuted, with no change whatever to report.

Gould & Curry.—The water is now nearly drained from the 1700-foot level. Within a very few days the exploration of the lower levels will be resumed.

Bullion—Some fine promising bunches of quartz are being met with in the south drift on the 800-foot level, and the prospects in that portion of the mine are looking more favorable every day.

Sutro.—The west tunnel cut through a fine vein of quartz and low grade ore 12 feet thick, during the week. This vein is of a very promising character, the ore assaying from $4 to $18 per ton, and the quartz being of a very lively healthy quality.

Savage.—Sinking the main incline goes steadily on, the bottom still in hard blasting rock. There is no new feature to report of the prospecting operations on the 2000-foot level.

Mint.—Sinking the shaft goes steadily on without change or interruption. It is the evident intention of the managers of the work, that the shaft shall have reached a depth at which there can be but little doubt of finding a paying mine, before they again cross-cut.

Dardanelles.—The drift for the ledge is now in 38 feet, running through very hard and tough rock this far, but it grows softer, and is changing to a whiter character, indicating nearer proximity to the ledge.

Leo.—Good progress continues to be made in driving the main tunnel ahead into the hill, and the ledge continues well defined, with the ore vein gradually enlarging and improving in quality.

Andes.—Some favorable ore prospects have been found in the north drift on the 300-foot level. Mr. James H. Sperliug has resigned the foremanship of the mine, and Mr. James S. Rule, an old and experienced mining man has been appointed to fill the vacancy.

Woodville.—The ore breasts on both the 200 and 300-foot levels are yielding the usual quantity of good ore, keeping the mill steadily running.

Daney.—Two drifts, one north and the other south, have been started in the ore vein, on the 400-foot level. These drifts are both in a fine ledge of quartz with some low grade ore.

Kossuth.—The ore prospects in both the main south drift and the south winze continue excellent.

Florida.—The new hoisting and pumping machinery is in place and nearly ready for work, and the building is nearly completed.

Senator.—Still drifting on the 400-foot level with favorable prospects.

Original Gold Hill.—The drifts at both the 175 and 340-foot levels still pushing ahead in low grade ore.

East Belcher.—Shaft sinking in hard blasting ground with indications at the bottom of changing into regular ledge matter.

Buckeye.—Sinking the main ineline for a new level has been commenced.

Occidental.—Sinking the winze, from the upper tunnel level, is making good headway, the bottom still in ore.

Tyler.—The water is almost drained from the shaft, and work will soon be re-resumed in the mine.

Continued on Page 380.]

The North Pacific Coast Railroad.

It was reportsd that the North Pacific Coast (narrow gauge) Railroad would have besn opsnsd from Saucelito to Tomales ahout December 1st. The company had its locomotives (four), passenger coaches, haggage and express, flat and box cars ready, hut the heavy storms so retarded the construction, and in some places damaged the new earthwork, that it is impossible now to be ready for traffic hefore Jauuary 1st, and if the construction parties are again detained by storms, it may be a fortnight, or even a month later. The Directors are determined on having the permanent track in as nearly a perfect condition as may be possible before opening the road to the public, that there may be no suspension of husiness, as has often been the case with other roads in this State, notably with the San José railroad in its earlier days.

The extraordinary difficultios the company had to contend with iu running through a mountainous conntry with a newly built road, will he appreciated when we remember that there have been no suoh antnmn rains as this season since 1849, and that in the Pacific Mill cañon, where the greatest destruction occurred, fourteen inches of rain fell in one storm.

The communication between Saucelito and the front was not resumed until this morning. There is now only a gap of ten miles to fill, and as the earthwork is nearly completed and all the bridge work done, with constrnction trains, working at each end, this gap can be closed within twenty days, if no very bad weather occnr. Most of the road has been permanently ballasted with gravel, and it is in excellent condition. The storms have not only consolidated the earthwork wherever it withstood the rush of water, but have demonstrated which are the weak places that will need watching. The other end of the line runs for many miles near the shore of the Tomales bay, that long, narrow inlet which separates all the Point Reyes country from the mainland. Wherever the railroad is exposed to the action of the waves the face of the embankment has been riprapped and secured in the most substantial manner.

At Saucelito the company is building freight and passenger sheds on the wharf, and also preparing a large quantity of piles with chemical preservatives for the extension of its wharf. The northern portion of Marin county has hitherto been in want of communication with San Francisco, except by sea, but will, when this railroad is completed, be as near San Francisco as San José. This want of communication has hitherto kept back population and improvements, but from this year it may he expected that Marin county will grow in wealth and inhabitants as rapidly as any agricultural county in the State. The many nooks and beautiful building sites nnder the shadow of Mount Tamalpais and White Hill, will, when once brought within easy access of the city, be as much sought after as those of San Mateo county.

Had it not been for the unexpected and now regretted antagonism of some of the San Rafael people, trains would now be running for the past three months three times a day each way over the branch which was built to connect San Rafael with Saucelito, and the passengers instead of paying 75 cents each way between that place and the city, would have been charged 40 cents, whether they traveled by San Quentin or Saucelito. If the matter is properly brought before the Supreme Court they will reverse a decision clearly made under a misapprehension of the facts, and San Rafael will be taken in "out of the cold."—*Post.*

Calaveras Iron Mines.—Rsferring to the advantages that would accrue to the rsilroad company hy opening up the iron mines of Calaveras, the Calaveras *Chronicle* suggests the building of a road from Milton, and says: "A branch road from Milton, the eastern terminus of the Stockton and Copperopolis line, twenty-five miles in length, would tap both the iron ore beds and timbered region of this county. A narrow gauge would answer every purpose, and to obviate a change of cars at Milton a third rail could be laid down from that point to Stockton at a small expense. The grading of the road from Milton to the mines does not present any serions engineering difficulties, and heavy gradients can be entirely avoided. The completion of the road—if its owners saw proper to engage in the manufacture of iron—would practically make them masters of that interest on this coast. Superior facilities for making, coupled with a short line of transportation, would enable them to lay iron down in San Francisco cheaper than it can be obtained elsewhere. But even if the railroad company was adverse to engaging in manufacturing, the completion of the road would lead to the immediate development of our mines. Thousands of dollars of capital stands ready to inangurate the work, the moment cheap and rapid mesns of transportation are assured, and once institutsd, the importance at which that branch of industry would ultimately arrive can hardly be estimated. The enterprise is certainly an inviting one. The consumption of iron on this coast is great and increasing, and there is no good reason why home manufacture should not take the place of importation in supplying the demand. The subject is worthy the attention of those who have it in their power to institute such an enterprise, and we hope to see it meet the consideration its importance deserves."

Central Hill Mines.

The most prominent and best paying claim in this district is the Rising Star claim, owned by J. C. Dyas & Co. This company have just complsted their hoisting works and huildings, and are now ready to commence taking out pay dirt. They are now hauling the tailings of the last two washings to a place where they can be washed again, and are confident these tailings will pay from $20 to $30 per day to each hand working.

The gravel in the channel pays from ten cents to twenty ounces to the pan. This is undoubtedly the richest claim in the channel, as far as prospected, having taken out a great many thousand dollars in the last six or eight months. The claim cannot be worked out in twenty years.

Next and adjoining this is the John Harkins & Co.'s claim. This claim prospects well, and from all indications will be as good as the former. They have also completed their hoisting works, and are now sinking their second shaft.

Next on the lead is the claim of John Shears & Co. This company have also completed their hoisting works and sheds, and are now sinking and pumping by steam power. There is considerable water to contend with in this claim, but with the aid of an engine they hope to reach the channel, where they will no doubt strike as rich gravel as in the other claims.

Adjoining this is the "Monitor." "This claim has been worked in former years by D. Latimer & Co., and a great deal of money was taken out of it as long as they could successfully contend with the water. Mr. Cole and a San Francisco Co. are now the proprietors. This company have pnt up works, they sunk a shaft 140 feet deep, and are now running a drift on the channel and getting out pay dirt. We have no doubt that under the present management this claim in a short time will commence to yield its thonsands, as of yore.—*Calaveras Citizen.*

Robinson District.—The White Pine *News* is informed that the farnace of Judge Walsh, at Mineral City, has again started up, and will continue to run along as usual. James Montgomery, formerly employed at this point, and under whose direction the furnace was erected, has left for some other locality, but his place is supplied by a competsnt man. We have never been informed whether the working of the furnace has been profitable or not, but we know that the success in working the same has been fully established. With the immense amount of croppings and surface ore found about Robinson, no one can doubt that, as a smelting camp, it has a bright future hefore it. Should success attend the operations of other companies during the winter, we shall not be surnrised to see other and substantial furnaces built next spring to reduce the ores being extracted now. Certainly no class of men have so persistently clung to their locations, through adverse circumstances, as have those at Mineral City, and reward must surely await them. Superintendent Elmore seems confident in the future of his company, and is constantly at work endeavoring to more fully develop his mining interests there. The mill of the Watson company was running at last accounts, and, we are told with good results.

The Krom Concentrative.—A correspondent of the *Silver State*, writing from Star City, says: During the month of November there has been shipped to the Reno mill by the Sheba company, 13,943 pounds of concentrated ore, which assayed $500 per tun, and 21,722 ponnds of dust which averaged $115 per ton. During the same period the Krom company shipped 71,340 pounds of concentrated ore, all of which was reducsd at the Krom Concentrating Works, from ore which averaged by assay $50 per ton. The celebrated De Soto mine was shut down and all hands discharged last week, hy order of the superintsndent, Judge Hydenfeldt, of San Francisco.

The Sheba is still in full blast, and report says the force will shortly be incrsased. It is hoped that a large quantity of ore will he extracted during the winter, and give the Krom works a long run through high water. To reduce ore by the Krom process it is necessary to have it perfectly dry, and the quantity furnished at present will not warrant the erection of a drying kiln. At present the works are closed down, and unless the weather is favorable will not resume work until early in the apring; at leas., so I am informed hy the manager: The high-grade ore produced by the mines is not redneed here, but shipped elsewhere.

Virginia City Coal Co.—The *Enterprise* learns that the second stratum of coal in the mine of the Virginia City Coal Company, in El Dorado Cañon, was penetrated day before yesterday at a distance of about 350 feet west of the main shaft. This measure, which is abuut 15 feet in thickness, pitches westward at an angle of thirty or thirty-five degrees. A tunnel from the main shaft, 90 feet below the measure, has been run for the double purpose of attaining greater depth upon it, and at the same time draining it. The measure has been cut at a distance of 350 feet from the shaft. A large flow of water followed, precepitating into the tunnel shale, coal, sandstone and mud. Work is being prosecuted nuder great difficulties, but the miners—some of the hest selected from the Comstock—are holding their ground, and in the course of eight or ten days it is expected the water will have been exhaustsd, when the vein will be opened to its full width. So soon as this is done the company expect to begin to take out coal in large qnantities for the markst

Peavine District.

The late developments in this district, says the *Nevada State Journal*, have given rsnswsd confidence in the success of the district, and an air of activity is visible on all sides. In the short time we were in camp it was impossible to obtain a complete report of the affairs throughout the district, but such information as we glean of the condition of the mines, we gladly place before the reading public:

Paymaster.

Work on this mine is progressing favorably. Men are now engaged in making the connection between the upper and lower levels. When this is completed the incline will be continued to the surface so as to he ready for the hoisting works. The ore breasts are all looking well and yielding splendidly, abont twenty tons of ore being extracted daily. The company have over two hundred tons of ore on the dump, which will be worked as soon as the McGlew furnace gets into operation—about Christmas. Thirty men are employed.

Golden Fleece.

Tbis is the latest excitement in the camp. The body of ore recently found by this company grows larger and larger, and from present appearances the Golden Fleece is destined to he one of the best mines in the district and in the State. Work is being prosecuted night and day and as soon as sufficient ore has been extracted it will be sent to the mill, and if worked to 50 per cent. of the assay value, the lucky hombres who control it have a splendid opening for a colossal fortune. San Francisco capital is being pnt iuto this claim; it is said Governor Leland Stanford has just given $7,500 for 1,500 shares.

Nevada State.

This company are on the north of the Golden Fleece, and have excellsnt pruspects. A tunnel is to be driven immediately to tap the same ledge, which it is calnculated will be accomplished in about 40 days.

Hopkins.

The Hopkins, the first south extension of the Paymaster, is lying idle, though we understand work on it will be commenced in a few days. This claim is considered one of the most meritorious in the district, and its friends claim that it will prove a better mine than the celebrated Paymaster.

Many other claims not now being prospected will resume work shortly, the recent development warranting the outlay of additional capital.

The Prospects

Of Peavine Mining Distriot are flattering in the extreme. Of course the successful working of the rebellious ores by the McGlew furnace there can be no question, and this is all that is needed to insure the future permanency of Peavine.

Covered by a Cap of Sedimentary Rock.—It is a fact known to msny persons here, but probably to few persons at a distance that to the northward of the Utah mine there comes in a sedimentary rock which lies across the course of the Comstock lode in that direction. Nothing bnt this sedimentary rock showing upon the surface, little prospecting has been done beyond where it sets in. As the Comstock doubtless keeps its course under this cap rock, there are probably as good mines in that direotion as in any other, could they be found. The cap rock is a speoies of coarse gneiss, and at one time, some years ago, a quarry was opened in it, and rock taken out for building purposes, and for use as flag and curbstones for sidewalks. The rock is too soft to he of much value for these uses, and of late years but little of it has been quarried. It would be an easy matter to bore through this cap rock, and by means of a diamond drill the continuation of the Comstock might he found hsyond the Utah by any company that might locate the ground and undertake the job. In case of finding it it would not cost much to sink a shaft down to it through the sedimentary rock. Should a strike be made in the Utah it would not he long before parties would be out north, horing through this oap rock in search of a continuation of the lode; indeed, such an experiment has alreadv been talked of hy some of our mining men.—*Virginia Enterprise*

Rising Star Ore.—The ore from the Rising Star mine in Flint district, Idaho, brought to the Humboldt Reduction works for reduction, was worked up to 95 per cent. of its assay value. The bnllion produced was 812 fine. The ore contains a large percentage of antimony and other hase metals, and the owners of the mine have expended nearly $300,000 in vain attempts to work it successfully. The mine is represented as looking well, and capable of producing an nnlimited qnantity of ore, and a good deal of it will be brought to Winnemucca by return freight teams from Silver city, as this is the only place where it has been worked successfully.

Raising Sunken Vessels.—The main feature of a new plan for raising sunken ships is closing hermetically the hatches and all openings in the upper parts and then to pump down air through tubes insertsd through the bottom. The air thus introduced rises toward the under side of the deck, and, not being able to escape, presses the water down and out through the holes in the ship's bottom. The vessel by this means will be rendered buoyant and rise to the surfacs.

Raymond and Ely.

Ysstsrday afternoon we took a stroll up to the Raymond & Ely mine, where wo wsre received by the efficient foreman, T. J. Andrews, who kindly showed us over the works. Since our last report a considerable amount of mason work has been done, setting the foundations for engines. They are being built in the most solid and substantial manner possible. They are clamped and bolted together with hnge iron rods iu such a thorough manner, that anything like stir seems out of the question. Not a great deal of the machinery has yet come to hand, and it is feared that the proapect of an early winter may interfere grsatly with the hauling from the railroad. However, every effort will and is being made to hasten the delivery, but the machinery is all of so ponderous and unwieldy a character, that firm and good roads are an essential condition to admit of its transportation. The work of enlarging and retimbering the shaft is almost completed, the pump and bod stations opened and prepared, so there will be no hindrance on that account. The machine shop of the company is now supplied with first-class appliancea for work. Since our last visit a magnificent lathe has been added, which includes all the modern improvements and offers every facility for finishing heavy work. A drilling machine has also been set up, of great power and is now a most a useful and ingenious piece of mechanism.

In the mine there is a much greater activity than heretofore. Since the acquisition of the Magnet ground by the company, work has been resumed on the eighth, ninth, tenth and eleventh levels. The ledge as exposed in the eighth level is very large and shows metal all throngh it. The average assays are not high, though some streaks are very rioh indeed. The lower levels are being pushed toward the air chimney with all convenient speed. The amount of ore being raised at present is from 20 to 30 tons per day, bnt the amount will soon he very greatly increased when the ledge is tapped on the lower levels. From the Burke mine some considerable ore has been raised. One of the company's mills is now at work crushing the ore that the mine is now yielding. Some 200 men all told are at work in the mine and on the snrface, their presence giving the works their former busy look.

The Silver Lake District.—Doc. C. D. Stoy returned this morning from the Winters miue, situated in the Silver Lake District, on the west side of the Walker River range of mountains. He says he is confident that at last they have got a mine in the district. The Winters has a shaft 250 feet deep, three tunnels running in upon the ledge—the longest of which is 350 feet, and numerous cross-cnts, drifts and winzes. The ledge is nine feet wide at the depth they have reached, and the ore body some 60 or 70 feet in length. The ore assays from $100 to $150 per ton. Some assays that have bsen made from seleoted ore run as high as $300. In the lower tunnel another fine body of ore is visible. At present the company are not shipping any ore on account of the condition of the roads. On the 19th of this month snow fell to the depth of two feet. In three days time a west wind came and drifted it in great heaps, blockading the roads and rendering teaming impossible. This storm took the inhabitants of the district by surprise, for it came much earlier than was expected. No winter supplies have been laid in yet. Doc. Stoy says that they have several good prospects or claims in the district; that the population is slowly but steadily increasing, and that all are contsnted.—*Gold Hill News.*

A Goon Deen.—We heard of a transaction yesterday which was so creditable to one of our prominent citizens that we cannot forbear mentioning it. In the transfer to the Raymond & Ely of the Magnet company's ground, the employes of the latter, to whom about two months' wages were due, were left out in the cold. John P. Kelly had acted as superintendent of the Magnet and had engaged the men, and though of course he was not legally bound, thought as a matter of princinciple he should see the employes paid, so yesterday he paid them out of his own pocket, taking an assignment of their liens as security. We think it a most creditable transaction on the part of Mr. Kelly, and more than justifies the entire confidence which this community places in him.—*Pioche Record.*

Paradise District.—Squire Meador informs us that the Credit Mobilier ledge, in Paradiso district, has besn struck in the tunnel seventy-two feet from the surface. There is plenty of ore, both gold and silver, in sight. The mine is owned by Allen M. Sadorus and Jerry Cope. The Governor Flanders, in the same district, is looking well. A drift is being run on the lead at a depth of fifty feet from the surface. The ledge is better defined than heretofore, and carries two feet of good ore. The Governor Flanders is owned by Capt. John Winn, to whom much credit is due for his perseverance and energy in developing it. Paradise district is destined to become a lively camp before a great while.—*Silver State.*

Change of Superintendents.—J. C. Corey, Esq., has superceded John W. Mineer in the superintendency of the Ida Ellmore mill and mine, and taken charge of the property. Mr. Corey is also superintendent of the South Chariot. He is a shrewd businesa man, a very clever gentleman, and eminently qualified for ths positions he holds.

Good Health.

The Philosophy of Pain.

Sir Hamphrey Davy, when a boy, with the defisnt constancy of youth which had as yet snffered nothing, held the opinion thst psin was no evil. He was refuted by a crab who bit his toe when he was bathing, and made him roar loud enough to be heard half a mile off. If he hsd maintained, instead, that pain was a good, his doctrine would have been unimpeachable. Unless the whole constitation of the world were altered, onr very existence depends npon our sensibility to suffering. An anecdote, which is quoted by Dr. Carpenter in his 'Principles of Human Physiology,' from the 'Journal of a Naturalist,' shows the fatal effects of a temporary suspension of this law of oar nature.

A drover went to sleep on a winter's evening upon the platform of a lime kiln with one leg resting apon the stones which had been piled up to burn through the night. That which was gentle warmth when he lay down, became a consaming fire before he rose up. His foot wss burnt off above the ankle, and when, ronsed in the morning by the msn who superintended the lime kiln, he pat his stump, unconscious of his misfortnue, to the gronnd, the oxtremity crumbled into fragments. Whether he had been lalled into torpor by the carbonic acid driven off from the limestone, or whatever else may have been the cause of his insensibility, he feit no pain, aad through his very exemption from this lot of humauity, expired a fortnight afterwards in Bristol hospital.

Without the warning voice of psin, life would be a series of similar disasters. The crab, to the lasting detriment of chemistry, might have eaten off the future Sir Humphrey's foot while he was swimming, without his entertaining the slightest suspicion of the ravages which were going on. Had he survived the injuries from the crab, he would yet have been cut off in the morning of his famous career, if, when experimeating npon the gsses, the terrible oppression at his chest had not warned him to cease inhaling the carburstted hydrogen, nor, after a long struggle for life, would he have recovered to say to his alarmed assistant, 'I do not think I shall die.'

Without physical pain infancy would be maimed or perish before experience could inform it of its danger. Lord Kaimes advised psrents to cut the fingers of their children 'cnnningly' with a knife, that the little innocents might associate suffering with the glittering blade before they could do themselves a worse injury; but if no smart accompsnied the wound they would cut up their own fingers with the same glee that they cut up a stick, and burn them in a candle with the same delight that they burn a piece nf paper in the fire. Without pain we could not proportion jour actions to the strength of our frames, or oar exertions to its powers of endnrance.

In the impetuosity of youth we should strike blows thst would crnsh our hands and break our arms; we should take leaps that would dislocate our limbs, and, no louger taught by fatigue that the muscles needed repose, we should continue our sports and oar walking tours till we had worn out the living tissue with the same unconsciousnesa that we now wear out onr coats and shoes. The very nutriment which is the support of life would frequently prove our death. Mirabeau said of a man who was as idle as he was corpulent, that his only use was to show how far the skin would stretch without bursting. Without paiu this limit would be constantly exceeded, and epicures, experiencing no uneasy sensations, would continue their festivities u til they met with the fate of the frog in the fable, who was ambitious of emulating the size of the ox.

Sir Charles Bell mentions the case of a patient who had lost the sense of heat in his right hand, and who, unconscious that the cover of a pan which had fallen into the fire wsa burning hot, took it out and deliberately returned it to its proper place, to the destruction of the skin of the palm and fingers. This of itself would be an accident of incessant occurrence if the monitor were wanting which makes us drop such thiugs quicker than we pick them up. Pain is the grand preserver of existence, the sleepless sentinel that watches over onr safety, and makes us both start away from the injury that is present snd guard against it carefully in the time to come.—*London Quarterly Review.*

Lead Poisoning.—A few months sgo, on an estate in the department of *Semi El Marile*, 26 people were taken seriously ill, of whom two died. The physicians who attended them were convinced it was a case of lead poisoning. It turned out that the lead was contained in the brine used for preserving butter. This brine, besides sugar and salt, held in solution saltpeter, acstate of soda aud chloride of lead; the latter is plaiuly the result of a reaction between sugsr of lead and salt. In six experiments, from 2 3 to 7.5 grains of sugar of lead were found in one liter of brine.

The butter, even when well pressed, contains a considerable amount of lead; and besides, the butter when not pressed, was nsed in cooking. A post-mortem examination shnwed lead in the intestines, liver and brain of those who died.

Some Points About Health.

There is a great drift of populatiou iuto cities taking place now in England as well as this oonntry. The spirit of civilization is affecting people everywhere, and this gathering of humsn beings into so necessarily compressed qusrters is offering peculiar facilities for the development and spread of disease. Consideration nf the publio health is constantly becoming of more and more public importance, as people come to live more and more dependently npon each other. Dr. Lyon Playfair, at the recent Social Science Congress at Glasgow, took this subject for his discourse, and showed how, by intelligent sanitsry regnlatiou, the dangerons tendency of city growth might be avoided and the public health be steadily improved. London, two centuries ago, lost yearly 80 ont of every 1,000 inhabitants; to-day, with its vastly aagmented population, the city loses but 22.4 ont of every 1,000. Glssgow, where the lecture was delivered, is more careless than London and the direct resalt is visible in a deathrate of 30 to London's 22.4.

The secret of individual health is cleanliness, the work of sanitary administration for the people generally is to force everybody to be clean. So far as the effort succeeds the health rate improves. The great epidemics of the middle ages came npou people who for years and successive generations did not know what it was to bathe. The filth that was an element of their lives was an element and cause alike of their deaths. Clean houses, clean water and clean air are the three points that Dr. Playfair demands as essential to health. Rivers from which cities drink must drain neither cities uor factories. There is a natural tendency of water to clean itself, but that ability is limited to a certain amount, and sewage in unlimited quantity may make a river poisonous; and again, clesn houses and clean air are only to be had by a oomplete breaking up of the over crowded tenement system, where nothing can be clean or pure. Remedy these evils and the way to health is comparatively easy. Nor is it possible forever to neglect them. Going from bad to worse in neglecting these possible causes become actual causes of disease, which once broken oat does not confine itself to the place or the class of its origin.

Bnt while untimely death may be averted hy carefnl management we have to admit that death itself is snre to come sometime. It is at best only postponed. The time that would be saved to the world by a lengthening of the term of life by enforcing greater care would not nearly equal that which would be ssved by the abolition of what may be termed nnnecessary sickness—the time lost in sickness by people who do not die but recover. In England 34 people are each sick 18¼ days for every individual who dies. If the rate is the same here our 500,000 annual deaths will demand 17,000,000 oases of sickness, with a total yearly loss of about 315,000,000 working days.

Treatment of Erysipelas.—The *Medical Record* states that in the Brooklyn city hospital the following has proved efficacious as a local application for erysipelas: Acetate of lead, carbonate of magnesia, camphor, each twenty grains, water one piut.

Useful Information.

Combustion of Coal.—Combustion is a chemical process, consisting usually in a combination of one of the elements of our atmosphere (the oxygen) with the fuel. The main substance of fuel, eapscially when it is coal, is carbon, and the chemical equivalent of this, 12, combines with two chemical equivalents, 2x16, or 32 parts by weight of oxygen, which is equal to two and two-thirds parts of oxygen for every part of carbon. A pound of coal requires thus two and two-third pounds of oxygen for its perfect combustion; as now one pound of this gas under ordinary atmospheric pressnre occupies a space of some 12 or 13 cubic feet, or two and two-third pounds of oxygen a space of 34 cubic feet, which in the air is diluted with four times this amount of nitrogen, it requires five times this quantity, or not less than some 170 cubic feet of fresh common air to furnish the oxygen required; it is therefore necessary to psss 170 cubic feet of air through the furnace grate in order to secure the perfect combustion of every pound of coal. If less air is passed, the combustion is retsrded, while an excess of air cools the furnace.

Colobing Matter in Chili Saltpeter.—The yellow color in native Chili saltpet r is caused by potassic chromate, and the v olet shade by manganic nitrate. The stones which are found with the Chili saltpeter are often covered with calcic chromate and magnesic chromate. In ordinary Chili saltpeter Iodine exists as potassii and sodic iodide; but if the saltpeter is free from potsssiums, iu ths form of sodic percodate.

Ammonia Sona Paocess.—This process is attracting much attention. Prof. Reed Gunsberg finds from his experiments thst the most advantageous yield of soda by this process depends on regulating the respective proportions of oommon salt, ammonia and water, so that at the end of the transformation there may remain a saturated solution of sal-ammoniac. The whole process hinges upon degrees of solubility.

Mud Spots on Varnish.—On this subject the *Carriage Monthly* remarks: High grade finishing varnishes, whether of Englisb or American make, possess their wearing qualities from the simple fact thst they retain their elasticity or oily principle to a great length of time. The surfaca h rdens sufficiently to resist dust and to admit of being washed, but the body of the varnish remains soft and sensitive, and mud allowed to dry on the surface of the varnish both stains it and extracts by capillary attraction the oil contained in the varnish. Each spot of mud, according to its size and shape, acts on the varnish immediately under it, bnt no further, from the fact that a suction is created by the evaporation of the moisture contained in the mud. Different kinds of soil act with more or less injurious effects. Sandy soil would have but a slight effect on a varnish which would be badly soiled by a more adhesive clayey soil, and the filth of a large city would be still more fatal to the gloss of a varnish.

Nickel-Plated Screws.—In car building nickel-plated screws are rapidly coming into general use. This grows ont of the fact that though their original cost may be a trifle more than silver-plated screws, yet as nickel does not oxidize by exposure to air, the excess of cost is more than made up in the durability of the plating. Hence, in nearly all of the large car mannfactories, nickel-plated screws are superseding silver-plated for nse in joinery work. Jnst why house-builders have been slow to practically recognize their superiority, we are at a loss to conceive, unless, indeed, they cling to the "penny wise and pound foolish policy" of making a trifling saving in original cost at the expense of an ultimately greater loss in dnrability. We are glad to notice, however, a gradual but steady increase in the use of nickel-plated screws in house joinery, which argues well for their final adoption for all such work, in which silver plated screws are now employed.—*Builder.*

Varnishing Paper Diagrams and Maps.—The first and most essential operation is the proper sizing of the paper, as, if this be improperly done, almost any kind of varnish will penetrate the paper so as to make oil spots. Glue-water of the proper consistency is the best protective against the absorption of the varnish. It should be of the right strength, however. If, after being dried, it cracks in bending a corner of the paper, it was not diluted enough. When dry, the map is varnished with a solution of mastic, sandarac, or some other colorless resin in turpentine or alcohol, or a mixture of both; experience shows the best consistency in order to lay it on evenly with a brush. In cold weather it requires more of the solvent.

Why Paints Crack and Peel.—A writer in the *Hub* thinks that the cause of paint cracking and peeling is to be found in the water which is contained in linseed oil, as it comes from the hands of the manufacturer. He made the experiment of boiling linseed oil by steam, until all the moisture was expelled from it. On using this oil, without any dryer, it was fonnd to dry in one-half the usual time. He then mixed with it some siccobast, using only half the usaal quantity employed to dry oil not boiled, and obtained similar results. 'The introdaction,' says he, 'of steam into the linssed before grinding aids in the expulsion of the oil; but it must stand a long time to precipitate the watèr completely.'

Impaoved Red Fiae.—Ordinsry red Bengal fire is usually a mixture of strontium nitrate, potassium chlorate, and sulphur. This mixture takes fire very easily, especially if damp nitrate has been used in making it, or if flowers of sulphur have been used instead of roll sulphur. M. Bottger recommends the following as a mixture which keeps well aud does not take fire spontaneously: One part of shellac and four psrts of very dry nitrate of strontium. The best way of making the mixture is to reduce the lac to coarse powder, and then half fuse it with the strontium salt. When cool, a mass is obtained which can easily be reduced to very fine powder.

New Enoravino Paocess.—M. de la Grye reports a new process in engraving on copper. It consists, says the *Scientific American*, in first covering the plate with a thin coating of adherent silver, which is in turn covered with colored varnish. The lines are then drawn with a sharp point, after the fashion of using a diamond for stone engraving, aud subsequently sunk into the plate by means of the actiou of perchloride of iron.

Something Woath Knowing.—It is said that the furring or coating on the inside of steam boilers may easily be removed, making the sarfsce appsar like new iron, by placing a quantity of raw potatoes in the boiler and letting them boil to pieces. After two or three days, open the man-holes and a sandy deposit will be fouad; brush it out and the boilers will be all right.

A Few drops of sulphurio acid will prevent any decay in solutions of gum-arabic. Herschberg says that by this acid the lime is precipitated as a snlphate.

An ingenious Frenchman in the Baltimore jsil has invented an improvement for sewing the heels on shoes, for which he has been offered $5,000.

Domestic Economy.

Zinc in Cooking Utensils.

Much care and caution should be exercised by cooks and house-wives in using cooking ntensils lined with zinc: The *Iron Age* says: Zinc is not a metal which can safely be used for lining cooking utensils. In its pure metallic state, zinc is not poisouous, bnt several nf its compounds are prejndicial to health or fstal to life, according to the quantity taken into the system. The zinc of commerce, which is seldom pnre, and often contains both lead and arsenic, forms various unwholesome compounds when snbjected to the action of acid and heat. Many of the vegetable acids are very powerfnl in their action on metals, and ziuc, eveu when pnre, is but little calculated to resist their corroding action. In any acid, when iron is preseut, zinc becomes the sacrificial metal snd is dissolved, thns setting up galvanic action, by the aid of which any acid, and even a solation of common salt in water, will attack it and eat it away with greater or less rapidity, according to circumstances. There are so many vegetable acids which are so complex in themselves aud in their reactions, thst we cannot here enter upon a consideration of the compounds which zinc would form nnder the circumstances indicated by our correspondent. Tin, though not entirely free from these objections, is altogether a safer metal than zinc as an inside coating for cooking utensils, and in some respects better even than vitreous enamel. While the enamel lasts, it is probably the best substance which can be employed for this purpose, but it cracks with the contraction and expansion of the metal to which it adheres, and these cracks become filled with matter which cannot fail, in time, to render unwholesome whatever is brought into contact with it during the operation of cooking. With recent progress in the manufacture of enamels, we seem to be approaching a degree of perfection in the art whioh will give us a substance both elastic aud insoluble, and which will answer this purpose admirably.

How to Make Oatmeal Cracknels.—Oatmeal crackuels, or bannocks, as the Scotch call them, are excellent indeed, and are nsually made as follows: Take the best quality of oatmeal and stir in barley with euongh water to wet it through; add a pinch of salt; let it stand for ten minutes to swell; then roll out the mixture a quarter of an inch in thickness, first flouring the board and rolling pin with wheat flour; cut it with a biscuit cutter, and bake in a moderate oven, as these cakes will burn quickly, and only require to be of the lightest brown. They will snap easily between the fingers, and are delicious for lunch, requiring no hatter to make them palatable. If put into a close jar, they will keep for several months. In the Highlands of Scotland they preserve their bannocks in the barrel of oat-meal, and can keep them a loug time.—*Phrenological Journal.*

Apples in Imitation of Ginoea.—To three pounds of very hard apples take two pounds of loaf sugar, aad a quarter of a pound of best white ginger. Put these in layers (having first sliced the apples in eight pieces and cored them) alternately in a wide-mouthed jar. Next day infuse an ounce of white ginger, well bruised, in about a pint of boiling water; let it stand till next day. Then put in the apples that have been two days in the ginger. Simmer slowly until the apples look clear. Take great care not to break the pieces.

Coffee.—The browned coffee of the shops should always be browned over, thus throwing off the grocery taint which it has acquired by exposure to the fowl air, being a powerful absorbent or disinfectant. The heating, which should make it a shade darker (the coffee of commerce will hear it), will also develop strength. By all means brown over your coffee, and keep it in a well corked bottle or jar, or what is better, brown as you want to use, thus having it fresh and strong, and better flavored.

Why are Fish Poisonous?—This question was recently discussed before the Medical Society of Konigsberg, Prussia, by Dr. Schiefferdecker. It is well known that prawn, rock-fish, oysters, etc., are, at certain seasons, unwholesome articles of food, and even poisonous. This does not arise from decomposition, nor from any observable change, as Dr. S. proves. He concludes that it depends upon a change in the blood, connected with the process of spawning.

Cocoanut Cake.—One-half cup of butter, two cups of sngar, three eggs, or the yolks of eight, keeping the whites for frosting, one cup of sweet milk, five cups of flour, half a teaspoonful soda, and one teaspoonful cream tartar. Bake in layers, as for jelly cake. Spread icing on each layer, and cover thickly with cocoanut.

Canned Fruits.—Make syrup with sugar and water, averaging a quarter of a pound nf sugar to each pint of juice; boil the fruit until done, fill the jars boiling hot, seal up immediately. Keep the jars warm before filling with the fruit.

To Preserve Cranberries.—Boil a pound of the fruit very soft in a little water, not allowing it to burn. Then add a pound of sugar and boil five minutes, closely covered.

Unjust to Nevada; Colorado Mines; Our Transit of Venus Party; A Sulphurous Region; Colorado Bullion; Longevity of Seeds; Japanese Paper Fans; The Milton Ditch; Marsh's Scientific Expedition; A Lengthy Run; Savage New Works; Completed, 378.

A DAILY stage line is now running from Bakersfield to Kearnville, and thence tri-weekly to Panamint. The schedule time for mail service between Bakersfield, Lone Pine and the Panamint mines has been shortened from five days to two. Feed is high at Panamint. It costs the stage company $25 per day to maintain the team they are obliged to keep there.

RICH BOTTOM OF GOLD DISTRICT.—The Indiana Hill, Cement hill and mining company, of which we spoke in our last issue, recently took over $1,000 in gold from a space of ground less than one cubic yard in dimensions. The gold was found on the bed-rock by the side of a boulder.

THE property owned by the Maxwell creek mining company, Mariposa county, has been leased to another company and work thereon will soon commence. This mine and mill were formerly owned by a French company and are situated about a mile from Coulterville.

THE English capitalists, Partridge & Co. who have recently made extensive investments in gravel claims near Placerville, have opened large and marvelously rich deposits in two of their claims. These gentlemen are greatly elated with the results of their investments.

MOORE & Co. give notice that mines and prospectors will be allowed to pass over their Cassiar trail free of charge.

Gravel Mining.

The late rains have furnished a supply of water to most of the hydraulic mines that are ready to commence piping. At some of the mines they were not prepared for such early rains, but they are rapidly hurrying up repairs and getting ready to wash. We hear of claims which have begun washing all over the State, and most of the miners report a long and prosperous season. Large extents of gravel have been prepared this year, for hydraulicing, and if the season is long, as is hoped, the bullion yield of California for the next year will be measurably increased.

A number of new mining ditches have been built this year, which will afford water for opening up new mines, or increased supplies to old claims. In Amador county, since the completion of the great Amador canal, they have quite an excitement, and are finding out that many of their deposits are richer than they thought. New claims are being opened up for work. In Nevada county the claims at You Bet and Little York are all at work, and in other parts of the county will be soon ready for operations. At Moore's Flat, in the same county, where the deposits are pretty extensive, they have had some troubles about not getting water at satisfactory prices. At that place the Blue Banks Company is stripping off a large amount of gravel, and washing off top dirt.

In Calaveras county a number of new enterprises have been inaugurated this year for working old and new ground. The old Red Hill claim is being fitted up so as to get more water under a heavier pressure. Water is to be conducted to the mine from the main ditch through a 10 inch pipe nearly a mile long, giving a 200-foot pressure.

Up in Plumas county they have been making very extensive improvements, and the North Fork mining company have made preparations for heavy work. Some of the details of the operation are mentioned in another column and next week we shall give a description of the mining property of the company. A large force of men have been employed all summer to complete the 25¼ miles of ditch and 8 miles of pipe. The ditch is 6 feet wide at the top and is 3 feet deep. The work of bringing the water to the mines on Dutch Hill has been very laborious and expensive, but the outlay will probably soon be repaid. They have an immense body of good gravel, and all the modern improvements in hydraulic mining to aid them.

In Placer county hydraulic mining is very active More ground has been fitted up for operations this winter than ever before. The Iowa Hill canal company will be able to furnish several thousand inches of water, and a large tract of very rich ground heretofore but imperfectly worked, will therefore be thoroughly mined. The Placer *Argus* says that at Todd's Valley, Yankee Jim's, and in fact all through the mining campe of that divide, the preparations for work have been extensive, and the prospects are of the best. Gold Run and Dutch Flat will begin in earnest this winter to work the Blue Gravel, the richness of which has been thoroughly tested, but which for want of fall for the sluices, they have been unable to work. The Dutch Flat tunnel was so far completed early in the summer that washing on one claim begun, but a scarcity of water limited the extent of their operations. The Gold Run tunnel, one of the most important mining works in the State, will soon be ready for use. By employing the facilities it will afford, the miners of Gold Run, will be able for the first time to draw on the real store-house of their wealth. The surface gravel has paid well, but nothing to what the lower stratum will yield Altogether the future of the mines of Placer county never looked better. In fact from all parts of the State where gravel mining is carried on we hear encouraging news. New ditches are being built, new mines are being opened, old ones put in order, and everything ready for a prosperous season. The California as well as the Nevada miners can congratulate themselves on the prospects of a busy time.

EUREKA BULLION.—The *Sentinel* states that the furnaces in Eureka district produced the following amounts of bullion in November. The Richmond produced 1,277,910 pounds; Eureka Consolidated, 780.765 pounds; K K Consolidated, 285.000 pounds; Hoosac, 260,347 pounds; total, 2.284.022 pounds.

THE bid of M. Beatty to build and equip the railroad from Colfax via Grass Valley to Nevada City for $500,000 has been accepted. He is required to have the road in running order by next October.

THE New York Hill mine, Nevada county, crushed 60 tons of rock at the Lawrence mill, and cleaned up $4,000, without counting the value of the sulphurets.

COMSTOCK ORE.—They shipped last month over the Virginia and Truckee railroad 3,272 car loads of ore, aggregating 22,764 tons.

THE inquiry of J. J. S., in relation to piling wood on a side hill will be answered in next week's issue of the PRESS.

THE Carson mint coined $492,069 in Nov.

California Mines.

So great is the excitement now with regard to the Comstock mines that attention is turned entirely in that direction, and California and other mines are left out in the cold. The Comstock mines are owned principally by residents of San Francisco, and a large part of the money which comes from them is spent here. Our foundries and machine shops are principally maintained by orders from the mining districts, and the largest orders come from the Comstock. Several of the largest buildings now being erected here are being put up with Comstock money, and really the recent developments in that district benefit this city more than any other place.

To the mining developments of California, however, the Comstock developments are rather injurious than otherwise. There is no use in offering a California mine of any kind for sale in this market. The capitalists are making so much money out of mining stocks and Comstock mines that they will not look at a productive moderate profit. Everything must be on the scale of millions, and big mines are all the rage. Properties of great value are lying idle all over California for want of requisite capital to work them, and it is impossible to make any of the men who usually invest in such securities look at them at all. They are interested on the Comstock, and that is good enough for them. They will talk about California mines by-and-by, but not just at present. It does not make much difference to the general public where the bullion comes from, as long as it brings property with it; but the residents of all the interior towns of California near mining districts are very much interested in the working of the mines near them. If these mines are idle, business is dull and times hard, and this is the case in many parts of the State. Capital is scarce in the interior of California, and many mines are idle which should be worked; but for the past few months it has been impossible to get any one to invest any money in these mines, a state of things which will last some time yet.

In the end, however, it will result well for California. Large amounts of money are being made by the capitalists, who will after a while turn their attention to California mines. Jones & Stewart have put considerable money into Panamint, and others will probably follow their example by investing in mines within the borders of this State. In a few months the value of the present developments on the Comstock will be comparatively well known, and prices will settle to something like a permanent basis. Just now, however, the stock market is in a fever of excitement, and everything is held at high prices. After the excitement is over, some of the millionaires may deign to turn their attention to California mines, and help us develop some good properties here, as they have helped develop those on the Comstock.

Academy of Sciences.

A regular meeting of the California Academy of Sciences was held on Monday evening last. The following donations to the museum were received. A collection of eggs of California and European birds, presented by W. G. Blunt; curious specimen of sulphuret of iron, found in a piece of West Hartley coal, presented by Wm. Ruesell; shells from Ounalaska, presented by Captain L. May, of the Alaska Commercial company; specimens of crustacea, from Monterey, presented by Dr. J. G. Cooper; marine fossils from Stanislaus county, presented by Dr. Hudson; fossil bones from the Blue Gravel Hazard mines, Placer county, found five hundred feet below the surface, in an ancient river bed, presented by R. H. Floyd.

The Secretary read a short communication from Dr. J. G. Cooper, stating that since he had made his remarks on the coal formations of California he had had an opportunity of examining the new edition of "Dana's Manual of Geology." This learned professor, the acknowledged leader of American geologists, goes farther than did Dr. Cooper in bringing down the Mount Diablo coal strata in the scale of geological time, for he considers them as well as that of the Rocky mountains as belonging to the lignite era of the Eocene. Although in both cases there are some cretaceous fossils found in and above them, he considers the presence of lignite as more important, especially as showing the existence of a decidedly tertiary vegetation. He believes that the cretaceous mollusca continued down into the Eocene epoch, there having been no important convulsion to destroy them until the middle of the Eocene on this side of the continent. This is a coincidence with Dr. Cooper's theory that there is here a bridging over of the gap between the two formations, remarked on the Atlantic side of the continent.

The eleventh paper in the series of Pacific coast Lepidoptera, by Henry Edwards, was read by title. Judge Hastings read two characteristic papers, which were placed on file. The committee to nominate officers for the ensuing year will present their report at the next meeting.

New Amalgamating Machine.

Mr. J. T. Tunbridge arrived in this city from the East a few days since, bringing with him one of his amalgamators or "gold traps" which he proposes to introduce here. One of these machines has been in use about a year in the mines of Sturges & Sons, Franklin county, North Carolina, where it has given satisfactory results. At these mines they have numbers of "ribbon veins" a few inches wide, of partly decomposed rock, so soft that in some instances it is piped out. This ore is crushed in arastras and then put through the "gold trap" without passing over plates, through pans or anything else. The rock yields about $2 per ton, and is worked for $1 per ton.

Having made a success of his machine on very low grade ores in North Carolina, Mr. Tunbridge expects to be successful in working the high grade ores of California. He is going to adopt the proper course to introduce his apparatus. He brings a full-sized machine with him, four feet long and two feet wide, of a capacity sufficient to dispose of the tailings of a twenty-stamp mill. This he will put up at one of the mills at Grass Valley at his own expense, work it at his own expense, and ask no assistance from any one except the privilege of putting his apparatus where he can prove to practical mill men and miners that it will do what he says it will. An accurate record of its work will be kept, and he thinks that the Grass Valley mill men will bear him out in his assertions after they see the apparatus working.

The operation of the "gold trap" may be briefly described as follows: It consists of two cylindrical vessels, placed one inside the other, the outer reservoir or vessel measuring about 4 feet by 2; at the end there is an inclined bottom. At the apex is attached a small inverted siphon; directly over this the mouth of a discharge pipe of larger dimensions, and communicating with the interior from this side, while the other point or end of discharge is turned upwards. The inner vessel or cylinder has a coarse sieve attached at both ends and so constituted that they can be easily removed when necessary. Inside of this is placed a multitude of pieces of amalgamated metal, of such a form that their packing is prevented, and to admit of the slimes passing through. The form to be used here is an S-shaped piece, giving a large amalgamating surface, and having no opportunity for the different pieces to pack together. In addition to this rough description of the apparatus, it may be mentioned that there are other precautionary attachments of less importance.

The method of working consists in passing the slimes of diluted pulp directly from the stampe, or from the end of the plates, or any other process of grinding of the ore into the inner vessel previously filled with water, and submerging the amalgam therein. The slimes quietly descend, percolating through the great mass of attractive matter, filtering out as it were. The fine particles of float gold are secured by their attaching themselves to the highly sensitive surface of the electro galvanic compound metals. Mr. Tunbridge leaves for Grass Valley in a few days and we hope our mining friends there will give him a favorable opportunity of thoroughly testing his machine.

Transit of Venus.

The following dispatch to the New York *Herald* from Prof. George Davidson, chief astronomer of the American expedition to Japan, is dated Nagasaki, Japan, Dec. 8. This is the only news so far received of the result of the observations of any of the Transit of Venus parties: During our observations of the transit of Venus to-day the weather was very cloudy and unpromising. The time at which it was calculated that the transit would begin passed away without our being able to record the exact moment of the transit and of the first contact of rules. After about a quarter of an hour, and before Venus reached the state of her second contact the observer at the equatorial caught a glimpse of the sun planet, and was successful in taking several measurements of planets.

During the interval between the first and second contacts, the time at which the latter contact occurred was obtained with success and duly recorded. Shortly after the second contact further measurements of distance between Venus and the sun's western edge were made with the micrometer. In all there were taken 150 micrometeric measurements of the line between Cuspus. Besides these, three micrometrical observations were made on both edges of sun across the meridian of Saturn, and similar views of the right and left edges of Venus in crossing the same line.

Eighteen micrometric surveys were made of the respective delineation of the sun and planet, by observing both the upper and lower limbs while on the passage of the meridian, and about 60 excellent photographs of the transit, during various periods of its occurrence, were taken. Extreme good fortune attended the astronomers, for just as Venus departed from the sun, clouds began to gather, and threatened rain. Toward the close of November we were enabled to telegraph the difference of longitude to Madivistock, so that the location of position here is definitely determined. At the latest accounts from Professor Hall his party were all well.

Aquarium and Flower Stand.

The beautiful cut on this page of our paper represents a combined aquarium and flower stand; a tasteful and appropriate ornament for the parlor or window. Still, the term ornamental is hardly adequate in giving our readers an idea of its merits; for when it is properly occupied by its aquatic, amphibious and floral tenants, it furnishes a worthy subject of study for the student of natural history. Its presence would have an improving influence on the youthful members of the household, and would tend to the development of a taste for natural history. Here they could watch the growth and habits of plants, fishes and amphibious animals. The cost of the stand with globe—unoccupied—would be about $17; with the different apartments properly filled it would probably be from $25 to $30.

For the cut we are indebted to the *Guide to the Vegetable and Flower Garden*, recently issued by R. J. Trumbull, seedsman of this city. We have seen nothing in the catalogue line that equals this in its practical suggestions, in its adaptability to the Pacific coast, and in its general make up. We shall occasionally appropriate information from this publication for the benefit of our readers.

The following directions for filling and managing the flower stand and aquarium were written by P. R. Hoy, M. D., of Racine, Wisconsin:

How to Fill the Aquarium.

First, cover the bottom of the tank to the depth of one-half inch, with pure fine sand, on top of which put an equal quantity of fine gravel; over this gravel sprinkle small ornamental stones, shells, coral, etc. Everything put into the tank must be thoroughly washed. Next put in position an ornamental central piece of coral, stone, or anything out of which you can construct an arch through which the fish can readily swim. Now fill the tank one-third full, with pure cold water from the lake, river or well.

Plants.

The best aquatic plant for ærating the water in the aquarium, is *Anacharis Canadensis*, found growing under water on the bottom of nearly all sluggish streams and ponds. The *Valisneria Spiralis* (eel-grass) is the next best, after which comes the *Myriaphyllum Spiralis* and the *Myriaphyllum Verticellatum*. There is a species of *Conferva* found in rapid streams, attached to stones, that is an excellent ærator, valuable especially during the winter when other plants do not flourish. If you get the *Anacharis*, remove all decayed stems and leaves, wash clean, and arrange in packets of 10 to 15. Make a hole in the sand, insert the butt-end of the plants, and secure in this position by pressing small stones about them. Insert in this way about six to eight bunches, and be careful to make them secure at the bottom. Roots are not necessary, as the cuttings will soon send out fine, white rootlets. Now you are ready to fill up the tank with water to within one and a half inches of the top. Wait two or three days before introducing the fish, that the plants may have time to commence growing.

The Fish.

Almost any small species of fish may thrive in the aquarium, but we think the best for the purpose are the red-bellied minnows and sticklebacks, all found in small streams. Select small fish; from four to eight for a tank holding from eight to 12 gallons. Such a tank will support four small ones better than one larger. Introduce also 10 or 12 water snails. The *Lymnæ* are the best; yet the *Planorbis* and the *Physa* are interesting. Better, however, get a few of every kind you can find in the ponds and stagnant pools in your vicinity. They feed on the softer parts of aquatic plants, and do not exhaust the oxygen mixed with the water, for they are air-breathing, and have to come to the surface to take in a supply of air to be used while they go about cleansing the plants and the glass of the tank with their curiously constructed jaws.

Food.

The best food for the fish is angle-worms and flies in summer, and fine bits of fresh raw meat in winter. Never give the fish more than they can eat at one time, for whatever is left will injure the water.

Position.

The best place for the aquarium is where it will be exposed to the sun at least one hour each day, in order that the plants may exhale oxygen, which can only take place under the stimulus of light. Too much light, however, is to be avoided, as the fish do not thrive when exposed to the sun, and the glass will be soiled by *conferveæ*, a green vegetable matter. In summer an out-door position is best, if there be sufficient shade. It is well to cover the aquarium, both for the shade and to keep the fish from leaping out of the tank.

Cleansing the Aquarium.

If well balanced with plants, fish and shells, the water will remain sweet for an indefinite time. We have an aquarium that has been in service for the last 12 years, and which does not require a change of water oftener than once or twice a year, and then only to renew the sand which becomes filled with excrementitious matter.

Benefits.

A well regulated aquarium is a beautiful ornament for the home, and one which is a perpetual source of amusement and instruction. It has the peculiar advantage of making us acquainted with forms and habits of animated existence which are commonly hid from our inspection. Thus its influence upon the family circle is wholesome and elevating, tending constantly to awaken in all the members, both young and old, an increased love for the contemplation of the wondrous skill and wisdom of the Great Creator.

Amphibious Animals.

If lizards, frogs or other amphibious animals are introduced, they should be provided with some surface above the water to climb upon. The rocks may be built above the water, or a piece of flat cork may be allowed to float upon it, when the animals will climb and produce no small amount of amusement and instruction.

Gold Fish.

Gold fish may be kept 10 or 12 years, (their average period of existence), by using the following precautions:

1st. Allow not more than one fish to two quarts of water.

2d. Use the same kind of water, whether well or river; change it every other day in summer and twice each week in winter.

COMBINED AQUARIUM AND FLOWER STAND.

3d. Keep clean sand and pebbles at the bottom, washing it occasionally or replacing with a fresh supply.

4th. Use a small net rather than the hand while changing the water.

5th. Feed with cracker, yolk of egg, lettuce or flies, one each week, except in cold weather. Feed but little at a time. Remove any crumbs that may remain on the surface after feeding.

6th. Do not feed at all from November to the end of February, and but little during the following three months.

7th. If there are growing plants in the aquarium, water need be changed but rarely.

8th. Keep from sun and in coolest part of room.

Seth Green gives the following advice concerning the care of gold fish:

Use any well, creek or river that is not impregnated with mineral. Change the water when the fish come to the top and stay there, breathing part water and part air; take out nearly all the water, leaving enough for the fish to swim in, and fill the vessel with fresh water. Never take the fish in your hand. If the aquarium needs cleaning, make a net of mosquito netting and take the fish out in it. There are many gold fish killed by handling. Keep the glass clean. Watch the fish and you will find out when they are all right. Feed them all they will eat, and anything they will eat; be very careful to take anything they do not eat out of the aquarium. If your fish die, it will generally be due to handling, starvation or bad water.

Mining Claims.

The first of January will soon be here and negligent miners are again reminded that they must do the work required by the laws of the United States on or before that date, or they will be liable to lose their claims. It is not to be expected that Congress will again postpone the time within which the required work must be done, nor is it just that they should do so. Plenty of time and warning has been given, and claim owners will have no one but themselves to blame if they forfeit their rights by not attending to their property in time.

If certain claims are not of any value, they will now be abandoned by the locators; and it will probably happen that some of the "jumpers" will get fooled in some cases, supposing that work is not done because it has been neglected. As a general thing, however, none but claims of some value will be liable to be jumped, and many of these claims have no doubt been "spotted" by this time by parties on the look out for just such chances. A good many miners will of course put off doing the necessary work until the last minute, intending to commence on the first day of January. Those who are left out in the cold by procrastinating can blame only themselves.

The best way, no doubt, for *bona fide* locators to do, is to patent their claims at once. This will save annual expenditure and give a good title at the same time. A patent is a very good thing to hold in case of a sale. The English purchasers of mining property will not now look at anything which is not covered by a United States patent, and it is an incentive to any purchaser to know that he is sure of a good title. In this connection it is proper to suggest to locators the propriety of having the original location properly surveyed by a competent surveyor, so as to have a perfect record to proceed upon when making application for a patent. The careless way in which measurements are usually made in original locations makes it difficult to get the official surveys for patents in accordance with the legal regulations. A lawyer in this city told us not long since that in more than half the cases where patents were wanted it was impossible to get the surveys to correspond with the original record of location. In many cases the ground was formally relocated to save trouble. It is always best to have a preliminary survey made before applying for a patent.

On File.—We have two letters on file received too late for publication, giving a detailed description of Tybo District, Nevada. One of these will appear in our next issue.

The Developments on the Comstock.

The recent wonderful developments on the Comstock are far ahead of anything before made on that famous lode. The great *bonanza* or ore body running through the Consolidated Virginia, California and Ophir mines seems to be improving in all directions. The general character of the ore is the same as in all mines—being a mixture of red chloride and sulphuret ores. The California mine has come suddenly forward as the richest mine on the Comstock, and Belcher and Crown Point, producing over a million a month, are thrown into the shade by the developments in the mine above mentioned. Mining experts who have visited the lower levels place most astounding estimates of the amount of ore in sight. Some of these estimate that in the Consolidated Virginia there is standing in the mine above the 1550-foot level, over $43,000,000 worth of ore, or about $27,000,000 in dividends. The estimates of the value of the ore in the California vary from $50,000,000 to $150,000,000.

Plenty of ore is found in the Consolidated Virginia, assaying on an average $600 per ton. At one place the ore body is found to be 140 feet wide. No ore has come from the lower levels but what has been taken from the winzes and levels, it being almost all virgin ground. The body of ore developed by the drifts, cross-cuts and winzes of the 1500 and next lower level is as yet totally undetermined as to the extent, no limit having been reached in any direction. The development, toward the north, of the ore bodies on the 1300 and 1400-foot levels is constantly furnishing results of increasing value.

In the California mine the discoveries are attracting universal attention. About a week ago the north drift on the 1500-foot level was connected with the south drift on the same level in the Ophir, thoroughly ventilating the mine and creating a fine circulation of air. Cross-cuts have been commenced on both the 1400 and 1500-foot levels to prospect the ore ven. The Virginia *Chronicle* says it is simply the continuation of the sulphuret and chloride ore body of the Consolidated Virginia, to the northward. This, taken together with the fact of the southwest body of ore in the Ophir butting square against the California line, and extending downward from the 1300 to the 1465-foot level, and that the cross-cut from the bottom of the south winze on the south line of the Ophir, 60 feet below the 1465-foot level, is developing a more valuable body of ore than anything yet found in that section, no longer leaves a doubt that the California has one of the richest and most extensive ore bodies ever discovered on the line of the Comstock.

The ore in the Ophir is the same as that in the Cons. Virginia, showing that both companies are at work on the same body. On the 1465-foot level the *bonanza* is constantly expanding and the value of the ore is almost daily increasing. It is estimated by those who have taken the pains to make the necessary measurements that there are now in sight on the 1465 and 1300-foot levels of the Ophir not less than 150,000 tons of ore. The *Enterprise* says that recently a great and almost stunning strike has been made in a drift near the north line of the California. A winze was sunk on the line to the depth of 35 feet, from the bottom of which a winze was run in a northwest direction a considerable distance in excellent ore. They then came back to within 25 feet of the winze and started a drift south toward the California. This drift is now in about 15 feet and is in the richest ore seen on the Comstock in many years; indeed the only ore of the kind ever found before was in the old Mexican mine. Specimens are here found that are so pure as to be maleable on some of their surfaces. A specimen taken out here on Saturday assayed over $8,200. It is thought that the ore in this drift will average $1,200 per ton. At last accounts, last evening, the face of the drift was in the same material.

The first result of these strikes has been a very exciting time in the mining stock market in this city in Comstock shares. From all appearances the old Comstock is likely to last many a long year and pan out its millions regularly. As one mine gives out another comes to the front, and each richer than the other.

To be Sold.—Under instructions from High Court of Chancery of England, Messrs. Cross & Co. of this city offer for sale the silver mine and property belonging to the Mineral Hill Silver Mining Company, at Mineral Hill, Elko county, Nevada. These mines yield about 600 tons of ore per month and are represented as looking very well at present. There are two mills on the property, one of 20 and the other of 15 stamps.

Three men on the way to Panamint from Pioche on foot became discouraged when about 70 miles from Pioche and started to return. When seven miles from Elko they were attacked by Indians and two of the men killed. The settlers are in pursuit of the Indians.

The frame of the building for the new hoisting engine, at the Savage mine, is completed, and the masons have commenced laying the foundations for the engine.

Unjust to Nevada.

California journals are copying a paragraph from a Montana paper to the effect that Montana produced more of the precious metals last year, per capita, than any other State or Territory. This is absurdly nntrue. According to the census returns of 1870 Nevada and Montana had at that time the following populations, respectively:

Nevada	42,491
Montana	20,595

The precions metal product of Nevada and Montana were as follows in 1873:

Nevada	$37,254,507
Montana	3,892,810

Allowing that the popnlations of Nevada and Montana have increased during the past four years in about the same ratio, and we have these results: Nevada, with about double the popnlation of Montana, produced nine and one-half times more gold and silver last year. Or, in other words, Nevada produced all of four times more bullion in value per capita in 1873 than Montana. Yet the statement referred to is quoted in many journals without comment. Should it be said that the statement was intended to apply only to the number of persons actually engaged in mining, it would still be qnite as far out of the way, for in 1870 there were 8,000 miners in Montana and 15,000 in Nevada. It makes but little difference, perhaps, but in giving figures so wild a mistake should not occur.—*Virginia Enterprise.*

Colorado Mines.—The Colorado *Register* ssys: From onr personal knowledge of operations and schemes now in progress, we are enabled to state positively and truthfully, that the business of mining in Gilpin connty has not presented so flattering an aspect for years as at present. Still the task of a mining reporter at this jonctnre is no easy one. With scarcely an exception, our large mine operators meet our requests for items with "wait for a dsy or two," "hold on for a week longer," "in a fortnight or less we'll he ready for you," at the same time giving ns no insight of what is going on. This makes our work just now a peculiarly unsatisfactory one. Nevertheless we shall endeavor to cnrb our impatience a few days longer, knowing that when the ban of silence is removed we shall he enabled to make public developments of a startling character. That the near future of Gilpin ocunty is to be marked by numerous brilliant mining successes is no longer a subject of speculatiou, as will ere long be made apparent to all.

Our Transit of Venus Party.—Information by mail, under date of Octoher 20th, from the transit of Venus station at Nagasaki, Japan, which is under the supervision of Professor Davidson, ie as follows: The instrumente of the party have been arranged for detailed adjustment. This work neoeesitated the cutting of a road for a mile up a hill 800 feet above the sea, and two miles south of the fort at Nagasaki. The summit was then leveled, in order that epace might he secured for observations. The work was heavy, and the carrying of observatories, piere and instruments was slow and laborions. The Professor contemplated building another observatory near the cahle station, to transmit and receive clock signals between Nagasaki and Wladivoetok for differences of longitode. Next he would connect his longitude and Venus etations by a small triangulatiou.

A Sulphurous Region.—The Winnemucca (Nevada) *Silver State* says: Right here in Humboldt, within a hundred yards of the Central Pacific railroad, and in the immediate vicinity of the eilver mines of the Humboldt range, are heds of sulphur capable, it is helieved, of eupplying the whole world with that article for centuries. These snlphur deposits are located in the Humholdt valley, not much over a mile from the Humboldt House, and prohably thrice that distance from the base of the Humboldt range. But little is known in reality of the extent of the beds, except that they cover a large area in the valley, and have been proepected in one place to a depth of several feet, where the excavations expose hundreds of tons of the pure article, which can he made available for oommercial purposes at no greater expense than loading it on the cars and shipping it to the great commercial centers.

Colorado Bullion.—The Central city *Register* eays: The shipments of gold and silver hullion from this county dnring the week ending November 18th, 1874, amount, in the aggregate, to $51,564 05, corrency value. Of this amount, $17,000 was in gold retorts, the remainder being eilver bare. Probahly not exceeding one half of the above stated gross amount of hullion ehipment can he claimed as the proceeds of Gilpin county ores, the balance heing from mines lying within dietricts adjacent and more or lese tributary to this county, and are always inoluded in our records of bullion shipments for the reason that they are not reported elsewhere in the Territory.

The Quartz hill tunnel has now reached a total length of 829 feet, and is still advanciug towards the core of Quartz hill, prohably one of the richeet mineral deposits in thie county, at the rate of two and a half feet per week. It has thus far ent five lodes, none of them at a sufficient depth however, to warrant working them, the last one heing 550 feet hack of their present workings, or only 280 feet distant from the gulch.

Longevity ot Seeds.

The ways and conditions of field and garden seeds are not altogether "past finding out," though there are few subjects involved in more doubt and uncertainty. We have on former occasions devoted considerahle space and labor to clear the way of the seed purchaser and make his path straight, and shall continue to make a proper use of such information as we can obtain on the subject.

The following table, showing at what ages seeds of different kinds are supposed to lose their germinating power, has been going the rounds of our exchanges of late. The estimates were evidently made from an Eastern standpoint, and after consulting parties who are well acquainted with the habits of these seeds in California, we have made such alterations in the supposed longevity of seeds, as the difference between the climate of California and that of the Atlantic States would warrant. These differences are in all instances in favor of our State; though this, like some other characteristics of the country, is barely worth bragging about. On the contrary, the longevity of seeds is extended in California by means of what is known to be our greatest climatic misfortune, the dryness of our atmosphere. We think it will he safe to consider the following seeds good in California for the length of time named:

	Years.		Years.
Artichoke	5	Lettuce	5
Asparagus	4	Maize	3
Garden Beans	5	Melons	10
French Beans	2 to 3	Mustard	5
Beets	5	Nasturtium	3
Cabbage	5	Onions	2 to 3
Carrots	4	Parsnip	1 to 2
Cauliflower	7	Parsley	3
Celery	7	Peas	4 to 5
Garden Cress	5	Pepper	4
Wster Cress	4	Potatoes	2
Cucumber	10	Radishes	5
Dandelion	1	Rhubarb	2 to 3
Egg Plant	7	Salsify	2
Fennel	6	Spinnach	4
Gourds	9	Strawberry	3
Leeks	2	Tomato	5
Thyme	2 to 3	Turnip	

As we stated above, the conditions that favor the germination of seeds are snch as leseen the period of their longevity. Exposure to the long and severe winters of the Eastern States would not extend the longevity of eeeds, but passing through one of their short, hot summers would arouse the latent germinating power, and thue the period of their longevity ie at once ehortened. Imported seeds that have passed through the tropice are materially damaged in this respect; so much so that careful seedemen will not handle eeede that have heen thus exposed. It ie not necessary that such exposure should he open, and the seed come in direct contact with the heated atmosphere. It is believed that germinating influences penetrate the most carefully sealed packagee, and when germination commences, decay begins.

In connection with seeds that are known to he good for a long time we have heard experienced farmers and gardeners declare—and from our own obsevations we are inclined to endorse the declaration—that such seede are improved hy age, and that they may advantageously be left to a period approximating that of their supposed fertility. It is hardly prohable that the properties of germination are entirely dormant or stationary at any stage of their vegetable life; and are we not justified in supposing that these long-lived seeds are really undergoing a steady though slow procese ot maturing up to the time when natural decay commences? And is it not prohable that the apparent inevitable "running out" of some graine and vegetables, is attrihutable to sowing eeed that has not been allowed the maturing time which nature has allotted it?

In response to enqniries recently put forth through the columns of the Rural Press, in regard to seed tests, a veteran California nurseryman called at our office lately, and suhmitted his test which he declares to he perfectly reliahle. His theory is that the presence of the germinating property in the seed is to be recognized hy an oily substance which exudee from the seed when crushed. It is well known that some kinds of seeds on heing crushed yield more oil than others; hut the test consiste in taking a numher of any variety of seed, and crush them upon a sheet of paper, giving a epace to each seed, then examine each with a magnifying glass, when the relative proportion of the germinating property may he ascertained hy the peicentage of the vital oil which they have emitted. Persone accuetomed to nsing thie teet on certain kinds of eeeds will learn what amount of vital oil they ought to give forth, and he able to judge of their fertility aocordingly.

The germs of all seeds should be of a pearly whiteness, and when the degree of whiteness of any given variety of eeed is ascertained, any varying ehade ehould he taken as evidence of deterioration. Grass seede exhibit less oil than most seeds.

Japanese Paper Fans.—The paper ueed in the manufacture of the Japanese fans, now so common in thie country, is obtained from the root hark of the mulherry tree. The figures upon the flat fans are printed hy a lithographic process, while those upon the folding ones are painted by hand.

The Milton Ditch.—The North San Juan *Times* says: We learn from Mr. V. G. Bell, that the Milton Ditch was completed to Poor Man's valley a week ago, and that water had passed throngh the Milton ditch to that valley as early as the 16th. In less than one week from this date water will be got through the ditch as far as Eureka South. This would hsve heen accomplished sooner, hut for the terrible storm thst prevailed from last Saturday nntil Tuesday evening. The rain and suow stopped all work on the ditch for the time heing. But for the storm mentioned the entire ditch would have been completed hetween Eureka and Backbone house. As it is, if the weather continues fair, the entire ditch from the Milton dam to Moore's Flat will he completed and water running through it hy the next month. The Milton company anticipate having water throngh the ditch from Milton to French Corral hy the 30th inst., and would have had bnt for the storm aforesaid. This is the most beautiful ditch ever constructed in the State. It shows whst engineering and mechanical skill can do. Hsmilton Smith, Esq., of the North Bloomfield Gravel Mining company, wss the engineer, and that company constructed the ditch under contract. The capacity of the ditch was intended for 2,200 inches of water, miners' measure, hut the care taken in its construction has increased its capacity to 2,500 inches. Persons who have seen sections of the ditch pronounce it very heantiful.

Marsh's Scientific Expedition.—A telegram from Cheyenne, dated Dec. 3rd says: Professor O. C. Marsh and scientific party arrived here last evening from the Bad Lands, south of the Bisck Hills. The expeditioo was very successful, notwithstanding the extremely cold weather and continued hostility of the Indians. The latter stopped the party twice when on their way to the Bad Lands, attempted a night attack on their camp, and otherwise molested them. The explorations were made under difficulties, hut resulted iu importsnt discoveries. About two tons of the remains of extinct animals were collected, among them many new to science. This collection will go to Yale College, and will soon be described hy Professor Marsh.

A Lenothy Run.—A correspondent of the Salt Lake *Tribune*, writing from Stockton, states that the Chicago compsny's second furnace has started np. Both furnaces are in full hlast, and working all right. The first furnace has heen in continual hlast since the 25th of May last, and will now run until the 23d of December, when a short rest will be taken, extending over the holidaye. This is the most remarkahle run ever made by a silver smelting furnace on the continent.

Savage New Works.—Good progress is being made in the erection of the building in which is to he set np, at the Savage mine, the new engine and hoieting machinery for the incline. As this new machinery ie to be of a sufficient capacity to sink the incline to a depth of 4,000 feet it will be of the most powerful description. The pits for the fonudatione of the engines and machinery are excavated, and the greater part of the stone for the mason work is on the ground.

Completed.—The tunnel which has been driven into the North Bloomfield mine is now completed, and a mau can walk from one end to the other. The entire length of the tunnel is about nine thousand feet, is from six to eight feet wide and as many high. It has taken about two years and a half to drive it, and the expense has heen enormous. The fluming will he completed, and the work of washing will then commence.

Signor L. M. d'Albertis, the Italian naturalist, who recently aecended the Afrak mountains in New Guinea and made important diecoveries, is now at Genoa preparing for a fresh expedition in the eame country. He will endeavor to penotrate into the district adjacent to Torres Straits, where mountain ranges of coneiderahle altitude are known to exist.

Lodes carrying rich ore in small and scattered veins in Colorado are now made to pay well hy means of concentration works. And veins carrying only 30 ounces of silver per ton, if running 40 per cent. lead, find a ready market at prices that afford a good margin of profit where the veine are etrong.

Smyrna is the only one of the great cities on the west coast of Asia Minor which has survived from ancient times, and etill retains its importance as a great emporium of trade hetween Europe and Asia.

Hints to be Remembered.

A note dated on Sunday is void.
A note obtained by fraud, or even from one intoxicated, can not be collected.
If a note be stolen it does not release the maker—he must pay it.
An indorser of s note is exempt from liability, if not served with notice of its dishonor within twenty-four hours of its non-payment.
A note by a minor is void.
Notes bear interest only when so stated.
Principals sre responsible for their sgents.
Each individual in partnership is responsible for the whole amount of the debts of the firm.
Ignorsnce of the law excuses no one.
It is a fraud to conceal s fraud.
The law compels no one to do impossibilities.
An agreement without consideration is void.
Signatures in lead pencil sre good in law.
A receipt for money is not legally conclusive.
The acts of one partner bind all the others.
Contracts made on Sundsy can not be enforced,
A contract made with s minor is void

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly condncted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundautly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuahle inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuha, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should he prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliahle and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in eome instances lower, than those of any other responsible agency.

We *can and do* get foreign pateuts for inventors in the Pacifio States from two to eix months (according to the location of the country sooner than any other agents.

Home Counsel.

Our long experience in ohtaining patents for Inventors on this Coast hae familiarized us with the character of most of the inventione already patented; hence we are frequently able to save our patrons the cost of a fruitless application hy pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicatione which will iuterfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, helieving that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as aseignees of patente, or purchasere of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it hae repeatedly happened that applicante have not only lost their money, but their inventions also, from thie cause and conseqnent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent businees of this coast has heen done, and is etill being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inveutions discovered here than any other agents.

Situated eo remote from the seat of government, delaye are even more dangerous to the inventore of the Pacifio Coaet than to applicants in the Eastern States. Valuahle patents may be lost by the extra time consumed in tranemitting specifications from Eastern agencies hack to thie coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential mattere, and applicants for patents can rest assured that their communicatious and business transactions will he held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for prodncing fine and satisfactory illnstratione of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in hringing their valuahle iscoveries into practical and profitable use.

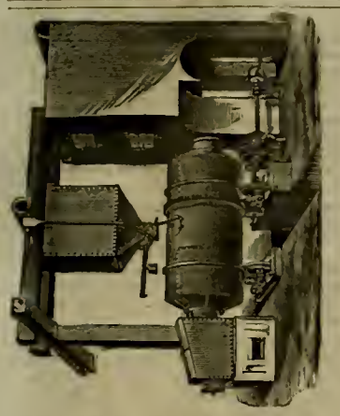
Mining Machinery.



TEATS' PATENT FURNACE.

TEATS' PATENT FURNACE

For Roasting, Desulphurizing, Chloridizing and Oxidizing Ores, etc. For the reduction of Gold, Silver, Lead and other ores, saving a larger percentage, at less cost, than any other invention now in use. Chloridizing Silver ore more thoroughly, in less time, with less fuel, salt and labor; also roasting Lead ore preparatory to smelting, better and cheaper than any other invention. The Furnace is so constructed that one man, of ordinary ability, tends five or more furnaces; controls them with ease; adding heat or air; stopping or starting at will; charging and discharging with ease. Also, Patent "Conveying Cooler," for conveying and cooling roasted ores, heating the water for amalgamation and the boilers at the same time. Saving the large space in mill (covered with brick or iron), and the labor of two men per day, exposed to the poisonous chlorine gases. Also, Patent Air Blast "Dry Kiln," for drying ores direct from the mine or breaker, saving fuel and labor heretofore necessary in drying ores for dry pulverizing. For description refer to MINING AND SCIENTIFIC PRESS, No. 18, October 31, 1874. For particulars address

TEATS & BREED,

No. 12 West Eighth Street, Cincinnati, Ohio

Circulars, &c., will be furnished, if required.

CROCKER'S PATENT
TRIP HAMMER QUARTZ BATTERY.

This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 240 blows per minute, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, $600.

G. D. CROCKER,

17v26-tf 315 California street, San Francisco.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND-POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apparture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference ae before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

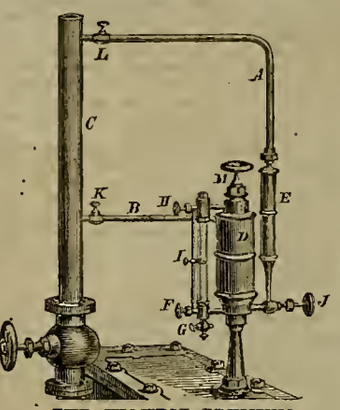
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23t

BALL'S
SWEEPING DREDGE,

A NEW AND VALUABLE

CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will hint little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $30,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Ayer's Hair Vigor

—FOR—

RESTORING GRAY HAIR

TO ITS NATURAL VITALITY AND COLOR.

Advancing years, sickness, care, disappointment, and hereditary predisposition, all turn the hair gray, and either of them incline it to shed prematurely.

AYER'S HAIR VIGOR, by long and extensive use, has proven that it stops the falling of the hair immediately, often renews the growth, and always surely restores its color, when faded or gray. It stimulates the nutritive organs to healthy activity, and preserves both the hair and its beauty. Thus brashy, weak or sickly hair becomes glossy, pliable and strengthened; lost hair regrows with lively expression; falling hair is checked and stabilized; thin hair thickens; and faded or gray hair resume their original color. Its operation is sure and harmless. It cures dandruff, heals all humors, and keeps the scalp cool, clean and soft—under which conditions, diseases of the scalp are impossible.

As a dressing for ladies' hair, the VIGOR is praised for its grateful and agreeable perfume, and valued for the soft lustre and richness of tone it imparts.

MINERS write for your paper.

Continued from Page 373.

Arizona.

Prospects.—Arizona *Citizen*, Nov. 21: Col. Boyle says the Arizona fever has just broken out in earnest, and that during the coming winter and spring, we may expect a great influx of solid, moneyed men, too. Several friends of his are coming down to buy lande. Regarding his operations down here, he says that he has the machinery for the artesian well building, and that he comes this time to stay. Everything looks favorable with him for the future in Arizona, and no doubt in a few months there will be much actusl work going on under his supervision in this conuty. The introduction of a Krom concentrator will be, in our opinion, just the machinery needed to suocessfully work most of the ores in this county; and the boring of one artesian well we hope will lead to the sinking of msny more.

Operations.—Judge Wymsn and Mr. Pearce left on Thursday for the mines at Clifton with a view to adjust some matters there and examine the mines, and return to Tucson. Mr. Pearce is now prepsred to make cash advances on ores rich enough to ship ahroad for reduction, and, after reduced and returns reported, will pay the owner every oent of the yield less the expenses of shipment, etc., as shown by proper vonohers.

Sometime ago, Mr. P. Lazarus sent samples of ore from the ledges at Cañon del Oro, to Castle Dome for assay. Monday of this week, he received from Mr. H. Goldberg, a telegram to wit: "Ore assays 32 per cent. copper and two ounces silver"—evidently mesning so much per ton of 2000 pounds. Here is another locality shown to contaiu immense qnantities of copper and some silver, for we are assured that the ore of which the sample was assayed, is almost without limit in extent. Now we have this, Clifton, Silver Mountain and Quacharty districts in which the proof is abundant of the existence of almost unlimited deposits of copper containing some silver. These several districts are quite acoessible and are certain to be within a few miles of the Texas and Pacific railwsy, and mnst at no distant day be yielding millions of dollars annually to those who properly work them.

British Columbia.

New Diggings on Vancouver Island.—Nanaimo *Free Press*, Nov. 25: From Mr. Patterson, C. E., who returned from a professional visit to the northern part of this island by the schooner "Alert," we learn the following particulars of an extensive discovery of gold-bearing country: Messrs, Coon, Johnson & Smith, who have been prospecting the entire summer on the streams and rivers running into and flowing out of Karuuutzen lake, state that they discovered diggings on the Nimkish river, flowing ont of the Karmutzen lake, and on the Kilpah and another river flowing into the above named lake, that will pay frsm $2.50 to $4 per day to the hand, and, perhaps, in favorable localities, $5 per day. About 10 miles of such diggings have been discovered and prospected, and it is believed that a larger area will he fonnd to be gold-bearing. The Nimkish river flows into the salt water about 21 miles south of Fort Rupert, Vancouver Island.

Colorado.

Among the Mines.—Central City *Reporter*, Dec. 22: The shipments of gold bullion from the two banks of this oity, during the week ending November 25, 1874, amonnted to $17,300,00, enrrency valne.

The First National Bank of this city shipped on the 27th inst. three silver bars of the aggregate coin value of $5,384.38, or a little over $5,800 currency value, being the result of less than a week's run of the Nederland mill on ore from the Caribou mine.

Wm. Mundie and associates are pushing their Spring gulch tunnel for the Canandaigua or Bucher lode, on Central City hill, and are now within four feet of it. This lode has produced considerable quantities of rich ore and qnartz, some of the latter running as high as seven onnces to the cord, or over $20 per ton.

The work of surveying for a county ditoh, through which a full supply of water for mining and milling purposes is to be derived, will commence on Monday next, nnder the direction of the Board of County Commissioners.

Clear Creek County Items—*Miner*, Nov. 20: The Steward reduction company are now in the market not only for silver ores, but for gold ore and ore containing silver and gold.

Rich Strike.—On Wednesday evening last, in the east end of the Fred. Rodgers mine, on Col. Connor's ground, ten inches of solid ore was strnck of a character not hitherto found in the mine. It oconred at a depth of 130 feet. An assay of this ore gives a coin value of $2,335 per ton, and the ore is expected to run over a thousand onnces in the mill.

Masonville Renuction Works.—An important enterprise for our county has just come to onr knowledge. The Masonville reduction works, together with several prominent mines, have been secured by certain gentlemeu here and in Philadelphia for the purpose of engaging in the bullion business. The works, we understand, are to he put in runniug order, and started early in the spring.

Pelican.—We learn from Mr. McCunniff that 100 men are steadily employed in this mine, working in the ground that is not involved in the lawsuit with the Dives.

San Juan District.—*Transcript:* Some 1200 pounds of ore arrived at the Golden smelting works on Saturday, all the way from the San Juan country. This ore was transported on nine "jacks" the entire distance of 350 miles, and will pay well for the cost and trouble of transportation. Part of it from the Hudson, near the forks of the Animas river, gives $360 per ton in silver, and the other part from the Equator, located near the famous Little Giant, will assay well in gold. Both mines will be he developed next spring when good wagon roads will expedite tranaportation.

Montana.

Sampling Works. — *Montanian*, Nov. 26: From inquiries we have gathered the following particulars concerning the sampling works erected last spring by Messrs. Dahler, Armstrong & Co., in the Bryant mining district. During the season jnst closed there was pnrchased at, and shipped from these works, upwards of 400 tons of silver ore, none of which yielded less than 90, and some as high as 1,500 ounces to the ton. In addi ion there were shipped from the Trapper lode 100 tons, which was redneed at Freiburg, Saxony. The Trapper rock was shipped by the First National bank of Helens on advanoe and commission (not purchased as previously stated), about 35 tons going *via* Corinne, and the halance over the Muscleshell ronte. The future of these works depends npon the district to a great extent, and is now full of promise. Several lodes will he worked through the winter, and if the prospects are as inviting in the spring as at present, the proprietors will erect rednotion furnaoes near their other works.

Coln.—Batterton Bros. were still running their Little Giant at Yamhill last week, and cleaned up $1,400. The cold snap this week would probably close the operations—the last on the bar. The mercury dropped down to 20 degrees below zero at the Penitentiary on Wednesday, and to 12 and 14 degrees in towu. So far, this has been the coldest November experienced in Deer Lodge for many years.

Flint Creek Mines.—*New Northwest*, Nov. 17: In common with many others, we have felt a strong interest in the result of the operations of the Flint Creek Ditch and Mining Co., in working the heavy bar on Flint creek. The seasou has passed without demonstrating positively whether it will be successful or not. It was late in the season before the ditch was completed; and then successive delaying breaks occurred deterring work. However, the Giant was finally started, a long cnt rnn to the bar, and quite a large pit opened, cutting through the rim and exposing considerable veins of gold hearing gravel. Having opened this up a cut was started frcm another direction, and some 70 or 80 feet higher than the former, and work prosecuted on this with good results nntil the cold weather stopped the operations. The company have thus pretty thoroughly prospected the bar, are satisfied with the situation, and will turn loose at it in the spriug.

Oregon.

New Discoveries.—Cor. Oregon *Sentinel*, Nov. 28: Having heen spending some time in company with others prospecting the mining country in Josephine county, I take this method to give publicity to some things I have seen. I have seen an immense qnantity of placer mines lying on the hills along Rogue river, from the month of the Applegate to three miles below the month of Galice creek, that would pay handsomely if some company would put in a large ditch from Applegate on the mountains above said hills. There are placer diggings enough here to employ a thousand men for the next 10 years to profit, if scientifically managed.

But the matter that took me into the mines was to see if the great ledge of quartz, discovered three miles below the mouth of Galice creek, was what it is represented to he. But now comes the incredible part that the ledge is over 125 feet wide. I have traced it for over 3 miles, and at different points have found where it is cut with small streams that run through it. It is cased the same as at the river, and on the left hand fork of Rocky Gulch it is wider than it is at the river.

Utah.

Stockton Mines.—Cor. Salt Lake *Tribune*, Dec. 5: A strike was made to-day on Mineral hill, in a new prospect which has not been named, about 400 feet below the Leonore. A body of galena ore was found at a depth of three feet from the surface. The party striking the same was driven off the ground. This, in connection with the strike, has created considerable excitement in mining circles and among prospectors.

The First National is at present working a large force of men under the supervision of W. E. Pratt. The main incline is in 150 feet, showing a well defined vein. They have 25 tons of good high grade ore on the dump, sacked and loose.

The Chicago smelter is running day and night, and to its full capacity, (two stacks) producing sixty tons per day. The dumps of the smelter are piled with thousands of sacks of ore, from the mines of Stockton, Dry canyon and Ophir. It is a very interesting sight to see the number of teams losded daily with bullion, bound for Salt Lake.

The Waterman smelter is not running at present. I presume they are making some necessary repairs. Their mine is constantly shipping ore to the smelter, and they have a large amount in the mine and on their dump.

The Jacob's smelter, it is rumored, will be soon turned loose again. We are sorry so complete a structure shonld be compelled to remain idle while there is so general a demand from miners to have their ores workod, as has been the case this summer.

General News Items.

Gone From our Gaze.—King Kalakus left for the East on Ssturday last, and will spend the coming week hob-nobing with the dignitaries at Washington. The universal verdict seems to be that notwithstanding the compsrative insignificsnce of his power and little island kingdom he nevertheless bore himself, while here, with true dignity—neither putting on nndue importance or letting himself down at all from his proper position. In all the manifestations of respect which were shown him, a propriety and decorum was observed on both sides, which was both agreeable and impressive. It is hoped and believed that he will meet with a similar degree of respect in such Eastern cities as he may think proper to visit, after paying his respects to the head of the nation at Washington.

—"But not Julius Caysar,
Nor Nebuchadnayzar,
Nor no man o' their day, sir, could iver compare,
Wid the Royal attendance
That did just hegin hence
To follow the King wid such anxious care."

Spain ann the Centennial.—The grest Spanish patriot and republican, Castellar, will represent Spain at the coming centennial. It is also rumored that the Prince of Wales will represent England at the ssme time. Many eminent men, whose views and public services make them citizens of the world will visit Philadelphis in 1876.

Wherefore.—It is said that experts sent by Mr. Hayward to examine the Crown Point mine, in which he is a large owner, were refused admiesion under gronnd. It will soon be in order to legislate that owners in mines may have the privilege of receiving their own property under, at least, reasonsble restrictions.

Locomotive engine explosions, which were almost unknown until within the last three or four years, are becoming quite nnpleasantly common. A locomotive exploded near Columhus, Ohio, on Saturday last, seriously injuring the engineer and killing his son, who was acting as fireman.

Nevada Narrow Gauge.—It is now said that the Nevada narrow gauge railroad is a certsinty—the contract is let for its construction and equipment. It runs from Nevada to Colfax. A road from Nevada to Marysville will soon he found a necessity.

Whipping.—They still tie up and whip in public in little Delaware. Eight meu and boys lately suffered that disgraceful puoishment there in the presence of several hundred persons, among whom were several women.

Frogs.—Frederick Dickman, of Virginia City, has discovered a live frog in the center of a tree four feet in diameter. Frogs seem to have a singular disposition to seclusion—to hiding themselves away in trees, turnips and stones. Why is it?

Varieties of Beer.—Four hundred different kinds of Berlin beer were exhibited recently at an international exhibition of beer and brewing interests, held at Hygenian, Alsace.

Luxurious Living.—There are probably 150 families in this city whose expenses are all the way from $20,000 to $40,000 a year. There are several whose expenses reach or exceed fifty thousand.

Great Loss of Life.—Twenty-one lives were lost on the coast of Scotland by a gale which prevailed there during Saturday and Sunday Nov. 28 and 29—nearly simultaneous with the heavy rains on this coast.

Land in New York City.—Peter Cooper, of New York, says that he was once offered a tract of land in New York city for $11,000, which would, to-day, command fifteen millione.

The Trade Dollar.—Mexican dollars are now quoted at a discount and trade dollars at a preminm—a fact which indicates that San Francisco is soon to control the trade in silver with China.

Thirty Lives Lost Near Cuba.—A Spanish coasting steamer ran ashore near Havana (Cuba) on Friday of last week, and immediately sank, with a loss of thirty persons.

Coulin't Stand Defeat.—A young lady at Burlington, Iowa, was so chagrined because she failed to spell the school down that she went and drowned herself.

A Fortune.—It is reported that D. E. Gilbert, of Hollister, has just received information that a fortune of three millions awaits him and five others at Norwich, England. Lucky men.

Absconded.—William Blake, a member of the S. F. stock-board, has left the city for parts unknown with $10,000 of other people's money.

The "Fisk Jr." Estate.—The settlement of this estate shows the amonut of $1,122,240 to he divided among heirs and devisees after paying all debts.

Several suicides and casualties have been reported the past week in various portions of the State. Suioides seem to be alarmingly on the increase.

Fooling Away Time.—It took a Detroit msn five weary months to whittle a broom-handle into a chain.

Wooden Cups are taking the place of glasses for sherry, such being the fashion now-a-days.

Reducing the Price of Gas.—Mr. Malam of Dumfries, has devised a mesne of distilling gas-coal by which he can avail himself of very high temperatures and thereby convert what would otherwise be liquid hydrocarbon compounds into permanent illuminating gas. The Glasgow *Herald* tells us that this gas engineer is able to take from three and a half to four thonsand cnbic feet of illuminating gas out of a ton of coal more than is extracted by any other system of carbonizing coal that is in general practice amongst gas msnagers. By this new system of working he still gets 17 candle gas from Newcastle gas coal, and 28 candle gas from Scotch cannel-coal, while the actnal yield of the marketable commodity is brought np to 11,000 cubic feet per ton in the former case, and to nearly 15,000 cubic feet per ton in the latter. During the year 1873, the Dumfries Gas Lighting company effected a saving of 986 tons of coal, eqnal to 30 per cent. compared with the previous year, under the ordinary method of working.

Fatal Railroad Accident.—A serious and fstal railroad accident occurred on Tnesday morning at Boca station, on the Central Pacific railroad. A freight train was side tracking for the west-bound passenger trsin, when it broke in two, and collided with the passenger, completely demolishing the caboose and one emigrant car, killing two passengers instantly, and badly wounding three others, who are not expected to live; also seriously injuring Conductor Bennett, who was a passenger at the time. He was thrown some sixty feet down the embankment, into a pile of rocks. Quite a number are still missing, snpposed to be in the river, as the emigrant car was thrown down the embankment.

Brutal Assault.—Just after going to press last week a most savage and brutal assault was made upon Mr. Thomas Newcomh of the *Call*, of this city, in the editorial office of that paper. Mr. N. was badly heaten, and the osse might have been a most serious one had not the printers in the adjoining room heard the disturbance and come to his relief. It seems almost a mockery of justice that such a severe and unprovoked assault should be coudoned for $300 in coin. Nothing short of ignominious imprisonment for a term should be the penalty for such an offense. Perhaps, however, the law rather than the jndge was at fault in the matter.

Tragedy at Merced.—A fearful tragedy occurred at Merced on Monday last in which Edward Madden, editor of the Merced *Tribune*, was shot dead by Harry Granice, step son of Mr. Steele, editor of the *Argus*, and son of Mrs. Rowenns Granice Steele. The affair grew out of one of those personal newspaper quarrels, which have become such a disgrace to the newspaper press of California. Public opinion at Merced seems to be very generally in sympathy with the deceased; in other places, where the parties are known it is very much divided.

Horse Racing.—The following advice given to an unsophisticated youth in the Eastern States is peculiarly applicable to this longitude about this time: "Never bet on a horse race, my son. It is wrong to bet, and, hesides, the horse that ought to win is likely, in nine out of ten cases, to he jockeyed to the resr. Do not bet at all, my son; hut, if you bet on horses, get acquainted with the riders in advance of the contest, and see how the thing is coming out."

Coal in Santa Cruz.—The Santa Cruz *Sentinel*, of Dec. 5th, in speaking of the late coal discoveries near Monterey, says: "They have opened out the drift some 40 by 80 feet and will push the work vigoronsly until they have as good a quality of coal in market as any other company. Mr. Sargent ssys they will have a depot in our town soon, where all who desire can obtain it for nse.

City Expenses —Our city fsthers have a bill of $2 000 against the treasury for toting "the king of the Sandwich Islands" ahout town. We say "squelch" that bill, and let those who dance pay the fiddler. Our people are taxed to death in this city, and they in turn tax the country whenever they can.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Dec. 8th, 1874.

For Week Ending Nov. 24th, 1874.*

Bee-Hive. — Peter Ole Peterson, Oakland, Cal.

Machine for Holding and Shearing Sheep.—Ephraim Chaqnette, Independence, Cal.

Implement for Shearing Sheep.—E. Chaquette, Independence, Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

Woodward's Gardens embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds, and Skating Rink. Admission, 25 cents; children, 10 cents.

Quicksilver.

The following item appeared in a recent issus of ths St. Helena (Napa county) *Star*.

"That we've got 'he fever' and got it bad there is no doubt. The St. Helena mining company and a half dozeu mors companies are daily bringing in new and important discoveries. The talk about psy rock, assays, per cent. gold, do. silver, quicksilver and so forth is becoming monotonous. Geutlemen give us less talk and let us see a little more of yonr coin."

That is jnst what is ths matter; too much talk and too little coin. Refsrriog particolarly to the quicksilvsr discovsries being made all over the State, it msy hs safely stated that sbout ons in 20 ever amounts to anything. The miners ars all complaining about the high price of quicksilver, and say that with all the new discoveries it ought to come down to a reasonable figure. If half of the discoveries were what they are represented, it would come down materially, hut unfortunately they are not. A little red rock is'strnck and straightway it is announced that "a new quicksilver ledge has been struck that is gradually widening as it goes down." The reverse seems to be the case with many of them, for they shortly drop ont of sight and are heard of no more.

Cheap quicksilver is one of the greatest needs of the mining community. They loss in workiog ore from one to two pounds per ton which at $1.55 per pound is a very important item even for small mills. With all the new discoveries the supply of this metal has not increased snfficiently to make np for ths deficiency cansed by the dscreased prodnct of the New Almaden mine. The demand is at the eame time very mnch grester than ever before and the price is bigher. Perhaps some 15 or 20 of ths mines discovered within the psst two years are producing metal, bnt by far the larger psrt are mere "prospects" on which more talk than work is done. The writer of thie, last year attempted to collect the statistics of quicksilver prodnction for the year and in tbe conrse of his investigations found that only some 10 or 12 of the qnicksilver mines of tbe State were producing any metal at all. The othere were getting ready or expecting to, hnt had tnrned out nothing.

It is very much to be boped that a few hundred more discoveries will be made so that one ont of 10 of them will be worked and increase the qnicksilver product of the State. Alter all onr talk about immense beds of cinnahar being discovered, it is hnmiliating to think thst we cannot supply the demands of tbe mining States and Territories.

Daily stages are now rnn between Healdsburg and the Geysers, by way of Pine Flat, Illinois city, Mercuryville and the Sonoma, Rattle-snake, Missonri, Oakland, Geyser, Mercnry and Kentuck quicksilver mines, leaving Healdsburg at 5 A. M., and tbe Geysers at 1 P. M.

The town of Panamint is not a favorable place to keen borses. It ie so far into the desert that feed ie amazingly dear. It coste the stage company $25 per day to maintain the team they are obliged to keep there.

Over three million feet of lumber have heen manufactured in Big Cottonwood canyon, Utah, this yesr and nearly the same amonnt in Ogden canyon.

About a mile heyond tbe Silver Bow in Oats canyon, Pope valley, they have struck a ledge of cinnahar eight inches thick.

Several boys are reported to have discovered rich gold diggings forty miles east of Sslt Lake.

The Crown Point mining company dishnrsed tbe following amounts one day last week: Pay roll for mine $89,700; psy roll for mills $3,560. Total, $93,260.

Bullion to tbe amonnt of $56,000 was shipped from Silver City through Wells, Eargo & Co.'s office during the month of November.

The Anaheim railroad is now finished to within 11 miles of that town, and will be completed by Christmas.

Miners throughout the State are preparing for a brisk season.

They are talking of another smelting establishment in Sacrsmento.

Santa Cruz will soon be supplied with Monterey coal.

Why Is It Popular?—Ask any fair minded physicial or any family in which it has been used, ask the whoin Drug trade, why *Hale's Honey of Horehound and Tar* ie so popular. The answer will he that the cures of ins veterate coughs, which it is everywhere effecting, are the topics of conversation in every city, town and village in the United States. Its enormous and constantly increasing sales are based upon the grend fact, notorious throughout the whole country, that it controls and masters every disease leading to consumption.

Pike's Tooth-Ache Drops—Cure in one minute.

Any Person receiving this paper after giving an order to stop it, may know that such order has failed to reach us, or that the paper is continued inadvertently, and they are earnestly requested to send written notice direct to us. We aim to stop the paper promptly when it is ordered discontinned. tf

The Mining & Scientific Press

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other pnolishere hava accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainabla for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a Practical Mining Journal it has no rival on this Continent.

It is the only Mechanical, and the only Scientific journal of the Pacific States.

Miners, Assayers, Milliman, and Metallurgist in the United States should take it.

Pacific Coast Mechanics, Engineers, Inventors, Manufacturers, Professional Men, and Progressiva and Industrial students should patronize its columns of fresh and valuable information.

Mining Engineers, Superintendents, Meisllnrgists, Mine Owners and Mine Workers throughout the world should profit by its Illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Intelligent thinkers throughout the land, in high or humble situatiou, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

No. 224 Sansome street, S. F.

Designing ana Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machnery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished therehy more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

Location of Dewey & Co.'s New Offices since July, 1874.

Mining and Other Companies.

Electric Mnining Company—Principal

place of business, San Francisco, State of California. Location of works, Lincoln Mining District, Butte County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 23th day of November, 1874, an assessment of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States Gold coin, to the Secretary, at the office of the Company, in San Francisco.

Any stock upon which this assessment shall remain unpaid on the fourth day of January, 1875, will be delinquent, and advertised for sale at public auction, and unless payments made before, will be sold on Monday the 25th day of January, 1875, to pay the delinquent assesment, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.

Office—Room 13, No. 318 California street, San Francisco, Cal.

"Golden Rule" Silver Mining Company—

Principal place of business, San Francisco, California. Location of works, Ophir Mining District, Utah Territory.

Notice Is hereby given, that at a meeting of the Board of Directors, held on the 8th day of Decemher, 1874, an assessment of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin to the Secretary, No. 530 Clay street, San Francisco, California.

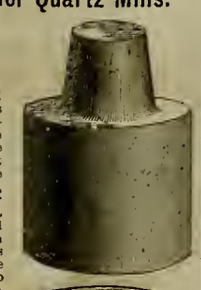
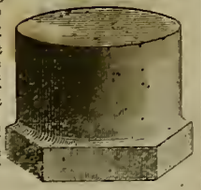
Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.

[PATENTED MAY 26TH, 1874.]
Price Reduced to 16 Cents Per Pound.
SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufactnrers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to rednce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently rednced the price to 16 cents per pound and solicit a trial order, guaranteeing that von will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufecturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not ont-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in nse in many of the largest mills on the Pecific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per ponnd. Their advantages over Iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.





Address all orders, with dimensions, to

TREADWELL & CO., San Francisco.

DEWEY & CO.,
American & Foreign Patent Agents,

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of good patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent.

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid.

Also a copy of NEW PATENT LAW of 1870

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

Address DEWEY & CO.,

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1,

For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2,

For medium and seamy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.

Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

☞ The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,
General Agents, No. 210 Front Street.

THE AMERICAN
TURBINE
Water Wheel.

Power Pledged Equal to any Over-shot Wheel Ever Built.

Recently improved and submitted to thorough scientific tests by James Emerson, showing the following useful effect of the power of the water utilized, being

THE HIGHEST RESULTS EVER KNOWN.

Percentage of part gate, ¼ 50.08; ½ 69 64; ¾ 78.73 ⅞ 82.53; ⅞ 82.90. Percentage of whole gate, 88.14.

Mr. Emerson says: "These are the best average results ever given by any Turbine Wheel in my experience."

A splendidly illustrated descriptive catalogue, or any further information desired, furnished on application to

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering two or more sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, baryta and quartz; and pyrites from quartz.

Added to a battery of stamps these machines constitute a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 15 or 20 tons per 24 hours.

For particulars apply to,

F. CAZIN, M. & C. E.
Supt. Denver Concentration and Smelting Co.,
At Denver, Colorado, Lock-Box 2225, or corner of Blake and 32d streets. ag8-16p

SAN FRANCISCO, SATURDAY, DECEMBER 19, 1874.

VOLUME XXIX Number 25.

Hydraulic Mining in California.*

No. 4.

Blue Cement.

There are exceptions, however, to this condition. We find this deposit sometimes changed into the hardest kind of blue cement, yielding only to the constant application of drill and powder. This cement is generally very rich, but has to be submitted to a crushing process in mills, similar to quartz mills. In such cases the hydraulic process can therefore only be applied till this blue cement is encountered, but it produces a double benefit, extracting not only the gold from the upper strata, but also freeing the blue cement from all incumbrences, and making thus its breaking up a comperatively easy matter.

Rotten Bowlders.

Next to the blue lead or cement a yellowish or reddish gravel is found, generally very rich. It is known in some localities under the name of rotten bowlders, and is composed of quartz, gravel, and bowlders of cley-slate. This deposit is from 5 to 25 feet in thickness, in some localities even thicker. It is rather soft and easily worked, and consequently excellent material for the "hydraulic."

Upper Gravel.

The blue lead and yellow grevel, or rotten bowlders, next to it, are the principal gold bearing strata; still, the deposits of quartz, gravel, and sand overlying these in huge masses, contain fine particles of gold, known as flour gold, in sufficient quantities to make the working of these upper strata sometimes very remunerative.

These different deposits gain their full characteristics only toward the deeper and more level portions of the channel or basin, and are less pronounced toward the sloping river or shore.

Quicksand.

As on the bars of the present rivers, great bodies of sand are found on the sloping rimrock, which, under the influence of water, become quicksand and form the greatest obstacles to the sinking of shafts or inclines, whenever found. This sand seems to be nothing but crushed quartz, and yields in many instances small particles of gold. In hydraulic mining it is rather an advantage, as it offers no resistance to a stream of water and facilitates the caving of any superincumbent strata.

Iron Cement.

Small streaks of a very hard, brownish cement, generally called iron cement, from one to two inches thick, may separate the different gravel deposits mentioned above. These cement streaks are easily crushed by the falling hank or a blow of the sledge, and thus disposed of.

Pipe-clay.

In almost all deep gravel deposits a sedimentary deposit is found, which is known under the name of pipe-clay. This deposit is generally found in huge masses near the rim-rock or shore of our deep gravel streams, and is evidently the sediment of immense bodies of muddy water. Fortunately that substance, which has really the characteristics of clay, and deserves its name, is very rare in our mines and only occurs in small layers. Even thus, it is troublesome and hard to dispose of, as water will not dissolve it, but turns it into a pasty, tough substance, yielding only reluctantly to the pick.

These mud-deposits, however, known as pipe-clay, or joint clay, break under the shock of a blast into fine pieces, dissolve in water, and have generally a worse name than they deserve. Their position is always close to the rim-rock and their bulk disappears toward the deeper and more valuable parts of the gravel deposit. To account for these facts it will be necessary to look into the origin of this so-called pipe-clay. It must be evident that the immense gravel channels of California were filled by periodical floods, occurring through the long ages; furthermore, that from time to time, and particularly when the rush of waters temporarily had lessened or almost subsided, great blockades in the ancient channels took place, keeping the remaining waters back and thus forming lakes. During such temporary intervals bodies of mud could settle upon the underlying gravel, and, reaching from shore to shore, form in time the deposits called pipe-clay, or joint clay. Any succeeding flood, carrying with it masses of gravel, sand, etc., would necessarily make a new channel in this mud deposit, destroying the middle portions of it, but leaving both shores comparatively intact. This explains the occurrence, near the shores, of masses of pipe-clay, which, as experience has shown, almost disappear deeper in the channel.

*Condensed from an article by Charles Waldeyer, in the last Annual Report of the U. S. Commissioner of Mining Statistics.

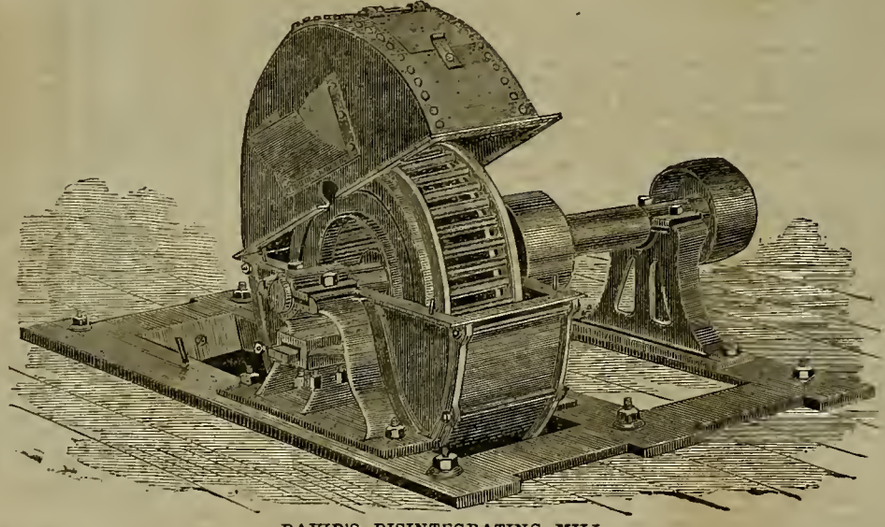
Consolidated Virginia. — The *News*, in speaking of the recent ore development in the Consolidated Virginia mine, says: Three crosscuts have been made in the ore to the eastward, at intervals of 100 feet. The southermost drift has reached the east wall. The ore at this point is 150 feet in width, and of a very superior quality. The next cross-cut, 100 feet further north, is extended 205 feet in ore of a much better quality than exists in the first mentioned drift. The distance estimated from the new survey of Mr. James, to the east clay wall in the course of this cross-drift, is 55 feet. It is expected to reach the wall in about two weeks from the present time. The third, or northwest crosscut, 14 feet distant from the north boundary of the mine, is in ore for a length of 39 feet. This ore is of a quality exceeding in richness any found in either of the other cross-drifts, or in any other part of the mine. All of the mining experts who have examined the ore in this drift, agree in pronouncing it the finest development ever made on the Comstock lode. The distance across the ore body at this point cannot be less than 280 feet. The appearence of the vein favors the belief that the ore will continue equally good for this entire width.

Borax.—Mr. Engelke, who has charge of Griffing & Wymen's borax works, situated between Columbus and Fish Lake, has concentrated or manufactured something over thirty-four tons of borax crystals during the month of November. It is understood that some additional works are to be built, designed to utilize the borate of lime, which rather preponderates over the borate of soda in that vicinity.

Major R. P. Hammond has been appointed general manager of the Central Pacific Division of the Atlantic and Pacific Telegraph company.

David's Disintegrating Mill.

The David mill or disintegrator proper consists of several cylindrical cages formed of round bars secured to disks and annular rings, one inside the other, and made to revolve in opposite directions, but presenting no scrubbing or grinding action. The materials to be disintegrated are received into the inner cage, and by the rapid revolving of the cages a centrifugal force is created that instantly projects the materials through the cages; disintegrating them by a system of free blows, from which no friction ensues. At this time—less than four years since the makers commenced offering the mill to the public—fully $150,000 worth of the mills have been put in successful operation, and the very fast growing demand for the mills indicates that several of the largest machine works may soon be exclusively engaged in their manufacture. This being the view of the patentee, Messrs. Denmead & Son, the makers, are about to offer the territory on our side of the mountains for sale.



DAVID'S DISINTEGRATING MILL.

A large number of the mills are used as herein mentioned, and many have purchased who are unwilling to disclose their use, but for disintegrating or pulverizing the following named materials: Peruvian guano, alone and mixed with other materials; South Caroline Phosphates, do.; merchantable steamed, boiled, and hard bones; slaughter house tankage, iron and other ores, cone ash, salt cake, carbonated soda, cracklings, coal, coke, oyster shells, clay for fire and building brick, fish from which the oil has been compressed, animal matter in almost all conditions, cement, concrete, peat, zinc ores, rock asphalt; also, for mixing cement, morter, sugars, etc. We are informed by the manufacturer that many of the small or 3-feet mills are grinding one ton of iron ore per hour, and many of them are grinding and preparing clay for 35,000 bricks per day each.

Very small mills are being prepared for grinding corn, etc., for feed. A 3-foot ordinary cley or bone mill will grind 120 bushels of corn per hour. Parties desiring information concerning these mills or patent rights may address Desmead & Son, Baltimore, Md.

Griffith's granite quarries, at Penryn, have become one of the most important institutions of Placer county. Polishing works are being erected, and tombstones of splendid quality will soon be manufactured. One hundred men are employed and large amounts of stone are being taken out.

An oil-cloth factory has been established in this city.

Next Year's Bullion Product.

Although the figures for the bullion product of this year have not yet been compiled, we are beginning to think already of the possible bullion product of 1875. Dr. Linderman, Director of the Mint, has been inquiring as to the probable productions of gold and silver during the coming year, with a view of regulating coinage. He announces as the result that from the Comstock lode alone a yield of forty millions is anticipated; that its production will, apparently, be only limited by milling facilities during the next two years. A part of the mixed bullion from Nevada will have to be refined at the Assayer's office, New York, the refining capacity of the Pacific Coast not being sufficient, and, therefore, arrangements will be made for that purpose.

What people will think of this statement who labor under the delusion that mining is played out on this coast, we do not know. The bullion production, as a whole, has been steadily increasing of late years. Nevada now heads the list, the Comstock lode turning out enormous quantities of gold and silver. We have a new and magnificent mint in this city which has as much as it wants to do to turn the bullion into coin, and as Dr. Linderman says the refining capacity of the coast is yet insufficient. In *three* days last week the mint in this city coined $1,600,000, the largest amount of coinage ever run in the same period. During November the refining works deposited at the mint $1,925,838 in refined gold. The mint at Carson coined last month $462,069. These figures convey some idea of what is being done now, and will without doubt be greatly increased next year.

In fact our mining is just beginning on this coast, and particularly in California. Thousands of quartz mines will be opened in this State within the next few years which will add their quota to the bullion product. The gravel mines are doing excellently and hundreds of new ones are being opened. Water is being brought to new areas of ground which will materially aid the bullion product. Altogether the mining interests are in a very prosperous condition all over the coast.

Trouble over Quicksilver Mines. — Advices from Santa Barbara mines state that a body of armed men have taken forcible possession of the Los Prietos quicksilver mines, situated in the Nojalayegna mining district. The parties claim a previous title to the mines, and express their determination to hold the same until the matter can be properly brought before the Courts. All work has been suspended, but no trouble is anticipated. The parties claiming the mines have put up a notice warning all persons against trespassing on the lands, cutting down timber, working in the mines, or otherwise destroying the property belonging to the Santa Barbara Quicksilver Mining company.

Black Hills.—Trouble has already begun in the Black Hills in consequence of miners going there in search of gold, in disobedience of Government orders. Dispatches state that the Indians have been defending their territory, and the result was a fight between a prospecting party and the savages. Two white men and ten Indians were killed, with nearly everybody else concerned badly wounded. Another party of miners have not been heard from since entering the debatable ground.

Moab Quicksilver.—It is reported that a Mexican from the New Almaden mines has discovered a rich vein of cinnabar on Six Mile creek, between Murphy's Camp and Angels, Calaveras county.

The Jacobs mill—the first at Panamint—commenced operations on Monday.

CORRESPONDENCE.

Tybo District---Its Mines and Mining Resources---A Glance at the Neighboring Districts.

EDITORS PRESS.—In pursusnce of a long entertained desire to visit tho district whose name forms in part the caption to this article, I jumped upon Belle's Tybo stsge at Eureka, on Thankegiving day, Thnrsday, the 26th ultimo, and was sgreeahly surprised to find myself, at 10 o'clock the followiug morning, slighting from it, tired and weary, in front of N. S. Trowbridge'e store, in the immediate vicinity of the company's works, Lower Tybo.

The dietance between Eureka and this point is usually reckoned at 100 miles. The rosd, with the exception of the first ten miles outside of Eureka, is in good condition indeed, when ths season of the year is considercd. The stage line is a new enterprise, inaugurated last May by Mr. Bell. Tbe dietauce between the aforessid points is usually accomplished in sbout 24 hours, in which is included tbe stoppages to chsnge and the time consumed in the delivery of the U. S. mail at

Morey.

Thie latter place is a mining camp of some pretensions. It lies emhosomed in the hills, four miles due west of the stage ronte, and is about 65 miles south from Eureka, and 35 miles north of Tybo. Tbe Morey company, to whom belongs the most of the mines in that camp, have a 20-stamp mill in constant operaiion upon ore supplied by ite own mines, and it ships its silver hars, via Eureka, to New York, where the majority of its stockholders reside. This hss been a paying concern from its inception upwards, and tbe cbances are that the future developments will give smple attestation of tbe enhanced value of the property. The ore is, I believe, free milling, and carries not more than one or two per cent. of lead, which doee not interfere in the least with its being freely and profitably worked. This is a valuable property, snd fully demonstrates the sagacity of tboee who have invested their money in it.

Rattlesnaks Canon,

Seven milee north of this camp, in the Hot Creek range of mountains, is the next place of note that we come to outside of here. This place was discovered and located a few years since, and some of its veins have been worked with considerable profit from that up to tbe present time. The veins are true fissure in character, snd sre small but extremely rich. Owing to there being no mill on the ground, the miners have been compelled to ehip their ores to eitber Belmont or Morey for reduction, hut principally to the former place. This they could very well afford to do with the rich ore at tbeir disposal. Tbese mines are directly north of and in a direct line with the Tybo compsny's property, and I have no doubt hut they are a continuation of the same veins ruuniug north.

Now we turn to the south-east from here, and trsvel the stage road 35 miles, to the old and well-known town of

Belmont.

Mr. Bell hss also established a semi-weekly stage line between this camp snd tbe former, thus affording facilities of travel not heretofore enjoyed by the public. Belmout is too well known and appreciated, ss a reliable bullion producing camp, to need mucb praise or decription at my hsnds. I will, however, say thst st no time since the discovery and location of the Belmont Mining District, has there beeu a better prospect for permanency and prosperity preeented to its inhsbitants thsn there is at tbe present moment. Tbe yield of the precious metsls promises to be unusually large in the future. Tbis is tbe unqualified opinion of the old practical miners of the camp, who know aud underetsnd what they give utterance to. The Belmont property, with its 6,000 feet of ledge, whicb averages seven feet wide, and yields from one hundred dollsrs per ton away into the thousands, is, in iteelf, sufficient to maintain the camp and afford work to hundreds of miners the year round. In a few months hence this valuable mine will he opened from end to end throughout ite full extent, with new and substantial hoistiug works erected at the extremities of the lode, over newly sunk perpendicular shafts. Tbese improvements will considerably enhance the value of the miue, and will place it besides in a condition to work with esse a large force of men. Next comes the Monitor-Belmont and El Dorado South, and several others whoee prospects are equally brigbt. The two lsst named incorporations have extracted from tbeir ground immensely rich ores, and in considerable quantities. Tbe Belmont company hss been working shorthanded for some time past, opening levels, etc., but I am credibly informed by those wbo ought to know, that over 100 men will be employed witbin the next two weeks, with a view to push forward, with the utmost dispatch, the projected developments.

Traveliug nortbweet the next place of importanoe wbich we enter is

Jefferson Canon,

A newly discovered district, which hids fsir to rival in extent snd wealth some of its sister districts. It is distant from Tybo district over a very good rosd, 45 miles, and it slresdy boasts of two new ten-stamp mills, lately erected by some of its public spirited citizens. One of tbese mills is now running upon ore from the Prussian miue. The yield is commensurate with the hope of its owners. The Prussian, North and South, are two of its principal mines, though there are quite a number of others in process of development, which promise equslly hig results accruing from them to their lucky owners. The rock is a fine free milliug quartz, found in veins from two and a half to four feet wide, encased beween well-defiued foot and haugiug walls. One noticeable feature observable in connection with the majority of tbe mines of the csmps located to the south of Eureka is, that the veins sre well defined and distinct in outline, snd that they invariably tend northwest and southeast, and maintain a perfect uniformity throughout their entire length. Tbere are, of course, occasional breaks to be met with, but these, as every practicsl miner full well knows, are unavoidable aud of frequent occnrrence in the best developed mines. Even the Comstock, well defined though it is, ie not entirely free from the evidences of the throes aud eccentricities of old mother Nature.

Having now glanced at a few of the adjacent mining districts whose leading features and excellencies I have tried to point out in the foregoing desultory remarks, I will retrace my wandering steps and bestow a few thoughts upon

Tybo, its Minss and Minsral Resources,

Considered from a mining standpoint, by oue whose chief aim it is to promulgate the truth and notbing but the truth in relstion to its merits as a mining center.

Retrospectively viewed who shall eay that Tybo has not made giant strides in the way of development aud material progresss within the paet nine months? This is but a short period in man's existence, aud but a mere bagatelle in dnration, and yet though brief has been the spau, how great has been the work which has beeu performed, and how vast tbe improvements which have been completed here during its passage, to the gulf beyond, let the facts which I subjoin testify.

Exactly nine months ago to-day, there appesred in the editorial columus of the PRESE sn article on Tybo from the pen of the writer hereof. My knowledge of this locality was, at that time, extremely limited, for Tybo was tben a kind of *terra incognita* to sucb ss did not dwell in its immediate vicinage. Tbere was but very little known to the outside world in relation to the charscter or extent of its mineral wealth, and not till the purchase of the "Two G," "Casket," "Lafayette," and "Hunksdori" mines, by the indefatigable John B. McGee, late superiutendent of the Richmond Consolidated Company's proporty at Eureka, on behalf of bimself and three otber geutlemen —two of whom reside in London and the third in San Fraucisco—became a *fait accompli*, did the district receive any considerstion in mining circles. Its advsntages were, however, known to a few of the miuing nabobs of tbe Bay City, wbo kept an eye upon its miues, chief among which were and are the quartette referred to ahove; yet, notwithstanding all their wealth aud vigilance, the present euperintendent of the Tybo Consolidated Compsuy's propeity, member elect to the next State Legislature, stole a march upon them, and, relying on his own judgment and experience, quietly purchssed ss aforesaid the property which he has since so admirably managed. It is to-day in a very prosperous condition, aud is a living monument of the skill, judgment and enterpriee which hss marked his course since he assumed untrsmoled control of it last April.

The Improvements

Consummated since that period give ample evidence of whst one energetic, vigorous minded man can accomplish when backed up by the sinews of war. Mr. McGee has been singularly fortunate in tbe acquisition of this unrivaled piece of mining property. Having an unlimited supply of high grade emeltiug ore on band, he immediately set about tbe execution of a furnace in whicb to reduce it. This was soon built and set in motion. It bas a reduction capscity of 30 tons each 24 hours. It is circular in form, above the well, and the ore has a fall from the feeding place of something like 14 feet, and its entire altitude is about 65 feet from its foundation. The amount of bullion rnn through each 24 hours ranges at about 7,000 pounds. This bullion has heretofore averaged net $400 per ton, and the indications are strongly in favor of it exceeding this standard in tbe future, for as depth is being attained in the mines the ore is found to be both rich and abundsnt, and the smeltiug ore also more highly impregnated with lead than it has been higher up towards the apex of tbe vein. The charcoal biu is very conveniently locsted bsck of the furnace, on the declivity of the same hill, whicb affords ample fall through the sheds for it into the car underneath, hy wbich it is taken to the feeders, a few yards distant. Here the coal is emptied from the car on to a medium sized screen, through which the emall and fiuer psrticlee of coal, which are valueless for smelting purposes, sre precipitated to an apartment underneath, from whence they are taken to the boiler, and utilized as fael, thus effecting a saving of one-third in the amount of wood formerly consumed. The coal bin, though elevated, is readily reaobed by an easy grade, one-third of a mile in length, which, in places along its course, had to he cut into the solid rock.

Lower down the hill is still another grade, of like extent, which connects the furnsce with the outer orifice of the tunnel, through which the ore ie run from the mine. Upon this grade is laid a 30-inch csr track, nicely ironed, over which the ore is transported in csrs (two) drawn by one horse with the gresteet esse to tbe furusce. These csrs which have a capacity of one and a-half tons esch, need not be changed from their originsl longitudinal position on the track to allow of their contents being discharged, the same as the common hsnd car is, for they open on the side next the furnace, and thus easily and quietly deliver the ore into the compartment prepsred to receive it. Tbe cost of transportation hy tbis easy method does not exceed 20 cents per ton; for a man snd horee, costing $6.00 per diem will deliver at tbe furnsce 30 tons, or snfficient to keep it going during the 24 hours. The boiler, engine and machinery are new and substantisl, aud admirahly sdapted to the purposes for which they are used. The engine has a 12-incb cylinder, is 30 horse-power, and has a 34-inch stroke, aud works in tbe smoothest manner possihle. The boiler is 16 feet long by 54 inches in dismeter, and the steam drum which surmounts it, has a length of six feet four inchee, by 30 iuches in diameter. The fly wbeel weighing 12 tons has a circumference of 36 feet, made up in segments firmly bound together. The boiler and furuace receivo a plentiful supply of the squeous element from a tank snfficieutly elevated, whose capacity is 16,000 gsllons, which is conetantly held as a reserve against accidents of any kind. The blsst is supplied the furnsce by one of Root'e number 6 patent force blast blowers, msnufactured at fhe Globe Iron Works, Stockton, California. This is by far the most powerful blower of its size which I have ever seen work. It is capable of giving five pounds of wind to the square inch, while a number 7 Sturtevant blower, makiug the eame number of revolutions, 100 per minute, could not when used in tbe early stages of operations here, concentrate more thsn 19 or 20 ounces to the square inch. Tbe present engine and blower are powerful enough to supply sufficient blast for an additional cupola.

The whole of the machinery, wster pipes, etc., are under tbe direct supervision of a very attentive aud skillful mechanic, Mr. J. H. Brydeu, late head engineer at the Richmond Consolidated Reduction Works, at Eureka. He is a man eminently qualified for the responsible position he occupiee; and is qoiet and unassuming, polite snd courteous to all with whom he has to deal.

The balance aud concluding part of this article will be forwarded in time for your next issue. The length ot this part of it admonisbes me that if I would retain the good will of the PRESS, I must for the preseut write *finis* and —J. D. POWEA.

Tybo, Nevada, Dec. 1st, 1874.

QUICKSILVER IN LOS ANGELES.—A correspondent of the *Alta*, writing from Los Angeles, says: There are, perhaps, but few who have heard of our immense and valuable lodes of cinuabar. Among the first discoverers ie our townsman, James W. Gibson. His firet discovery in this district was a lode of an average width of four to eight feet, now called the Ethiopisn; his second was the Rocky mountsin—100 feet in width. Then followed the followiug lodes Red, Wbite aud Blue, Silver Moon, Rough snd Ready, Sentinel, Mereney, etc. Mr. Luke Smith has also located in the same district the following uamed lodes: Solon, Occident and Bumblebee, the average width of said lodes being from three to forty feet. Ore for assays from all these different mines is now in the hands of some of the best assayers of San Francisco. The location of the mines is 60 miles uorth of Los Angeles, on the stage road to Bakersfield, and six miles southwest of Elizabeth Lake. We have wood and water in abundance; the former consisting principslly of osk; the latter in streams sufficient for all mechanical purposes.

MANHATTAN MILL.—Tbe *Reese River Reveille* says: Wells, Fargo & Co. shipped for the mouth ending November 30, 1874, for account of Manhattan S. M. company, 62 bars of bulliou, weighiug 5,032 pounds, and valued st $74,933.79. There was produced hy the Manhsttau mill, during November, additionsl to the above, 19 bars, weighing 1,911 pounds, valued at $25,384.17, which did uot get in iu time to he included in the Novemher shipmeut. This brings the monthly product of the mill up to $101,367.87.

SAGEBRUSH is the great item of fuel at the Humholdt Reduction Works, and at Kemler's flouring mill. It is cheap and is more desirable for making steam thsn wood; besides, there is but little trouhle in keeping the boilers clean when sagebrusb is used.

IT is stated that there sre 300 coal mines in Russia, of which about twenty bave really some title to be called serious undertakings, and but three iron works, one of whicb helonge to the Crown.

THE steel trade in Austria is makiug great progress; ths production during ths past two years has been 135,000 tons and 150,000 tons respectively, whereas, in 1863 it did not exceed 7,000 tons.

Property in the Mining Counties.

For a number of years psst, ssys the Stockton *Independent*, property in the mining counties has been grestly deprecisted in vslue by enormously high rates of taxstion. The burden hss been ss heavy ss the people cculd possibly hesr, and in eome instsnces sbsolutely crushing. Many persons who accumulsted fortunes during tbe flush days of plscer mining by trading in the towns and villsges stuck firmly to the spots where fortune smiled upon them, until at lengtb they found tbemselves bankrupt. Otbers found their way to San Frsncisco, where they invested advantsgeously and are now ricb. As a rule those who retsined the cssh they hsd aecnmulated, invested in mountain cansls, roads, brick and other buildings have been thus fsr disappointed in realizing their expectations. When miners were flourishing money was accumulated very rspidly by locsl traders. The mouey was sent off, however, instead of being retained for the work of future development. The mines built up San Francisco with a rapidity that has no parallel in the growth of cities. Had one-half or one-sixth of tbe capital which has found its way from the mountains to the metropolis of our own State and to otber States and countries been retained, no foreigu capital would have been required to plsce machinery on every gold-bearing quartz vein in the iuterior. To those early settlers in the mountsin towns and mining districts who have held their grip, struggled along witbout faltering and retained their foothold in a region where the work of development is only in a measure begun, the country owes a debt of gratitnde. During the long season of slow change in tbe system of miniug the residents of the mountain districts have been under a cloud, which is at length beginning to vanish, but how rapidly it will wholly disappear time snd events can alone determine. Happily the prospect is gradually brightening, tbsuks to the tenacity and industry and energy of the courageous band who have not deserted the field which yet contains millions of hidden gold. Additional value will he given to property and new life infneed into bnsiness generally in tbe mountain districts by tbe settlers procnring titles from the Government for their farms, orchards, gardens and mines. This will give a feeling of security which has not heretofore existed, and will lesd to renewed activity, more extended labor and venture and soon change the condition of affairs from cbronic dullness to a scene of life and vigor in botb old and new iudustries. We helieve tbat the mining counties of California have passed through their eeverest ordeal, and that a prolonged period of prosperity is openiug up before them. Property is appreciating in value, satisfactory exhibits continue to be msde in heavy miuing enterprises, and there is evidence of more hopeful anticipations and esrnestness in productive pursuits generally. The extraordinsry determinstion and unflagging vigor shown by the residents of Mokelumne Hill in their unconquerable struggle against sdversity, may be alone accepted as a type of tbe geueral spirit and temper which animates and actuates the people of the mining counties at the present time.

FROM CHERRY CREEK.—We are plessed to hear from gentlemen just in from this camp, that indications were never better than at the present for a splendid mining camp in the near future. Even those leaving there for Panamint declsre their iutentious of returning at no distsnt day, if tbe outlook does not exceed anything they ever saw, and we have no doubt that early spring will find many returniug prospectors on their way back to Cherry Creek. As we have repeatedly said, and as we firmly aud truly believe, time will bring out many portions of Wbite Pine county which will vie witb any new district now known. However, tbese new excitements attract many people away from us, and reuder our future just so much longer of reslizstion, but sooner or later, the adventnrous and uneasy prospectors will return to their first love.

DISAPPEARANCE OF THE DANUBE.—The Swise jonrnals have just reported a strsnge phenomenon which has tsken plsce in the Upper Danube. This river has suddenly disappeared hetween Morhingen and Immindingen, upon the frontier of tbe dacbies of Baden and Wurtemburg. Already for more than half a century it has been observed tbat near this point a portion of the water hss filtered through calcareous rocks to appear once more near the town of Aach in tbe Hohgau between Engen and Stockbach. In soher truth, the wbole mass of tbe river has disspeared in a similar manuer near to Immindiugen, all the locality is deprived of its water-falls and supplies; and it really seems to be a difficult engineering task to attempt the only reparstion by stopping up the holes by which tbe water filters away in the porous and crevassed rocks which form the separation between the Swiss Jura and Suabian Jura.

THE new fly wheel for the Consolidated Virginia mill on the Comstock lode, is perhaps the largest ever made. It weigbs 33,000 pounds, and was manufactured in this city.

SILAERADO, Napa County, contains a botel, three saloous, a butcher shop, a private bosrding houee and a dozen dwellings.

RUNNING.—The mill of the Eherhsrdt & Aurora compsny, at Eherhardt, still continues to run along on full time and on good rock.

SCIENTIFIC PROGRESS.

Photography in the Science and the Arts.

One of the most important applications of chemistry to the arts is seen in photography. Chemistry not only contributes to our physical comforts, but also gratifies our æsthetic nature, when it enables us to fix on glass or paper the shadows by every conceivable form of beauty. Photography and photo-lithography have rendered familiar many of the rarest works of art otherwise inaccessible to the vulgar gaze. On the other hand, photography has spread among us the most perfect delineations of such works as Krupp's, at Essen, as well as of apparatus and machinery. What is more instructive than the photographic pictures which the lecturer is now able, by the aid of a magic lantern, to throw on the screen before his audience. Animalcalæ and infusoria too small to be seen with the naked eye, as well as the great sun, the planets and stars, all come within the range of the photographic camera.

Until chemistry had become a science, photography could not exist, and many of the greatest improvements in the latter have sprung from new discoveries in chemistry. The importance of this branch of applied chemistry has induced us to devote a portion of our space to a record of the improvements reported in photography.

New Photographic Spectroscopical Observations.

Dr. Vogel has observed that not only pure bromide but also iodide and chloride of silver are by far more sensitive to the blue, green, yellow and red rays than hitherto alleged.

If the slit of the spectroscope be opened to 0.25 or 0.3 millimeter, and if the exposure is long enough, the three bodies are indeed sensitive to nearly all the rays of the spectrum, the least to the extreme red rays, and most to the indigo rays.

Pure dry iodide of silver is only slightly sensitive, but under nitrate is more sensitive to ultra violet and indigo than the iodide. The sensitiveness increases from violet to indigo, but near the —G— of Fraunhofer it diminishes suddenly, and the other colors act very forcibly.

Chloride of silver, colored with naphthalin red, gives a curious result. It becomes most sensitive for yellow rays, less for red, and least for blue. If it were possible to make chloride of silver more sensitive, the colored salt would be the very body for taking pictures in colors.

FORMATION OF FLINTS.—The following, extracted from a paper read before the Geologists' Association in England, by Mr. Hawkins Johnson, F. G. S., gives in brief the most advanced theories with reference to these formations: "The nodules are found all to agree in possessing a silicified organic structure, which may be described as a network of fibres, or a mass permeated in every direction by anastomozing canals. This structure was subsequently filled in with other material, such as carbonate of lime, silica, bisulphide of iron, phosphate of lime, carbonate of iron, etc.; the particular substance thus filled in depending upon the relative abundance of the substance dissolved in the interstitial water of the surrounding matrix. The singular groups of concentric, silicious circular bands seen upon many fossils, and known as orbicular silica, or Beckite markings, are also explained. The fossils on which they occur were imbedded in a matrix more porous than themselves, and of irregular constitution, so that the evaporation, to which the consolidation of the dissolved silica in their porea was mainly due, occurred at a number of points on the surface of the fossils, at which points a deposit of silicate took place, forming the central tubercles. The cessation of evaporation was followed by a fresh saturation with the solution, to be again evaporated as before. But as the evaporating points were now plugged up by the previous deposits, the silica last consolidated was deposited around their margins, and upon them internally, appearing outwardly as a ring round the tubercle."

ACCIDENTAL DISCOVERIES IN SCIENCE.—Accident has had much to do with chemical discoveries, more perhaps in former times than now, when researches are undertaken with some definite end in view; but how many of the discoveries which have led to the most brilliant and important results, may not be called accidental? We may question if Davy expected to find potassium when acting on potassa with a voltaic battery, although, having already observed the decomposition of other metallic oxides, he may have had an inkling of the fact. Bunsen did not expect to find two new metals when examining the residue from the Durckheim waters. Crooks, when looking for selenium, accidentally found thallium. Perkins, when he found that aniline, when acted on by chromic acid, gave a fine color, could scarcely have expected the enormous manufacture of those analogous dyes which is carried on at the present day.

DIFFERENCE OF TEMPERATURES OF CITY AND COUNTRY.—The temperature in the city is higher than in the country, where in general it is cooler, especially during clear nights, when the difference may amount to 13° Fahr. Then the extreme temperature for heat is higher in the city, while that for cold is lower in the country; but in the average differences between heat and cold the country surpasses the city, which is more moderate.

The Sum of Tyndall's Life Theory.

The London *Globe* says: "Professor Tyndall's laborious address to the British Association may be readily summed up by the simple restatement of a very old argument. An egg contains all the material necessary to form a chick. It holds also, for a time at least, the force requisite to construct the animal out of its component elements. The only thing needed is to set the formative process in action by the application of another form of force or motion called heat. But this last must be supplied from without. The sum of Professor Tyndall's researches is precisely analogous. He finds in matter 'the promise and potency of every form and quality of life,' just as the naturalist and the organic chemist find the organic materials of a chick, and the promise and potency to form one, within the egg-shell. But neither the philosopher nor the experimentalist can go one step beyond the facts. They are wholly unable to explain the something from without, in whose absence neither an egg ful nor a world of life can be called into palpable existence. This is the point at which philosophy again arrives—the old point at which it has been arriving by various paths ever since the first effort to penetrate an insoluble mystery. The Egyptians symbolized the difficulty, and their inability to surmount it, by offering the mysterious egg reverently to their gods. They laid the unsolved problem of the finite at the feet of the Infinite. Professor Tyndall and the British Association might learn wisdom, without humiliation, from the ancient idolaters, and emulate their not ignoble submission."

SCIENTIFIC BALLOONING—THE BLACKNESS OF THE FIRMAMENT.—The balloon ascent of MM. Croce Spinelli and Sivel has yielded many facts of interest. Among these we may mention the following: The elevation reached was 20,700 feet. They found that the temperature steadily diminished, except when passing through clouds, and finally reached 22° C. At 11,800 feet, crystals of ice were visible floating between them and glistening in the sunshine. The lines in the solar spectrum, indicating the presence of vapor of water, disappeared when they reached the greatest altitude, thus proving that this vapor belongs to our atmosphere, and not to the sun. At 13,100 feet, sensations of discomfort were removed by the respiration of a mixture of 40 parts of oxygen and 60 of nitrogen. At 15,700 feet the oxygen was increased 75 per cent., and in each instance the physical and mental weakness was restored, and the sky, which, previously to the inhalation, was of a dark hue, again became blue. M. Croce Spinelli has thus removed an old error, and has demonstrated that the blackness of the firmament observed at great hights is due solely to the effects of fatigue on the nervous system.

MEASUREMENT OF THE CHEMICAL ACTION OF SOLAR LIGHT.—Dr. T. L. Phipson, F. C. S., in a note to the *Chemical News*, says: Many years ago I made some experiments on this subject in Paris, and described a method which I believe capable of giving more accurate results than any hitherto obtained. Having discovered that a colorless solution of molybdate of ammonia in sulphuric acid became greenish blue when exposed to the sun, and colorless again during the night, and that the amount of chemical action exerted to produce this tint may be accurately determined by a dilute solution of permanganate of potash, it suffices to operate always upon the same quantity of substance, and to expose it to the light for the same period of time, in order to possess a perfectly accurate process by means of which the chemical intensity of solar light may some day be solved in a completely satisfactory manner.

DARWINISM.—There is one objection to Darwinism, says a late writer, to which little, if any attention has been given: For example, the nearest creatures to man in form are not the nearest in intellect. The elephant, and dog and horse, which have no affinity to man, have a far closer intellectual affinity than those pets of Darwinism, the gorilla and chimpanzee. Again, man is omniverous—the stronger races of men, from the Greeks before Troy to the English of to-day, are primarily carniverous. But no monkeys or apes are carniverous. If a man is to be developed from a lower creature, he is nearer to the monkey in form, but to his faithful friend the dog in mind.

THE STUDY OF CHEMISTRY.—We often hear it said, by way of excuse, that the study of chemistry is so dry, and the time required so great that the student must begin young or not at all. Now this is simply nonsense. There is no branch of science so interesting and none more easily acquired. Three or four hours a week for a few months would so open up the eyes and interest the understanding of any ordinary mortal that, without laying any claim to the prophetic mantle, we may safely assert that he who will make the trial shall have provided for life a source of pleasure for himself, and a power to interest and instruct his fellow men.—*Western Photographic News.*

THE AMERICAN ELECTRICAL SOCIETY.—An association to be known under the above name, was recently organized at Chicago, Illinois. The objects are an interchange of knowledge, professional improvement of members, the advancement of electrical and telegraphic science, and the establishment of a central point of reference. General Anson Stager, of Chicago, was elected president, and Mr. C. H. Haskins, of Milwaukee, vice president.

MECHANICAL PROGRESS.

Philosophy of the Welding of Iron.

The science of molecular mechanics is yet in its infancy; and for this very reason it presents a rich field for investigation and experiment. We are already acquainted with iron, for example, in very many physical conditions.

We have learned within a few years how to obtain it melted like steel and cast iron. But how numerous are the things which yet remain for us to learn, in order to understand the properties of even these various states of iron; in order to explain the peculiarities which they present when viewed from the standpoint of construction; in order to establish the relation which should subsist between these molecular states and the resistance of the metal under various strains; in order to have as definite a theory for working iron cold as for working it hot. This knowledge which may be called the physics and the molecular mechanics of iron, is still very rudimentary.

* * * * *

I will attempt to lay before you a sketch of what I foresee in these molecular studies, at present unfortunately too much neglected. I will enter upon the subject through a phenomenon well known to everyone.

It is a matter of common knowledge that iron is capable of being welded; that if two pieces of iron be heated to a temperature, called for this very reason a welding heet, and then be pressed together, either by hemmering or by energetic pressure, the two pieces will be firmly united; *i. e.*, welded together. Why is this? The only explenation which we can find in the best works on chemistry or metallurgy is the following: "At a white heat iron acquires the property of being welded, a property which it shares with the metal platinum only." But obviously there is no evidence here of any mysterious and special property of iron called weldability; there is only the effect of a very general cause, the manifestation of a molecular property elsewhere abundantly active in nature.

Take two pieces of ice, and a temperature just below zero, press them even very gently together; they become at once welded to each other. This is the phenomenon, first observed by Faraday and subsequently investigated in so fascinating a way by Thompson and Tyndall, which has received the name "regelation." Thompson explains it in the following manner: For all bodies, like water, which have the property of diminishing in volume as they liquify, pressure, which tends to bring the molecules closer together, lowers the temperature of fusion. Consequently, when two pieces of ice are rubbed against each other, fusion takes place between the surfaces of contact, at a temperature below zero. Of course, as soon as the pressure ceases, solidification is again produced and the pieces are welded together.

It seems to me that the welding of iron is a phenomenon exactly similar to regelation. [Such cases of actual regelation or welding of iron are sometimes seen in the welding of a spindle to its step when heated by friction, in the absence of any lubricating fluid.—EDS. PRESS.] The two pieces of iron are brought to a white heat, that is to say, more or less *near* to the fusing point. The repeated blows of the hammer, or the pressure of the rolls, lowers the point of fusion and causes a superficial liquefaction of the parts in contact, and thus welds the masses together; and this, because, like water, iron dilates in passing from the liquid to the solid state. Many other metals are similarly endowed; they all, therefore, may be welded like iron, if other conditions do not come in to oppose the manifestation of this property. Platinum welds easily at a white heat because its non-oxidizable surface, like that of ice, takes on a superficial fusion. To weld iron successfully it is necessary that its surface should be clean, that is, free from oxide. Iron containing phosphorous welds more easily than pure iron, because its point of fusion is lower. Steel, which is more fusible still, welds at a lower temperature than iron, but the process is a more delicate one. Silver, too, like iron and platinum, has the property of expanding when it solidifies; but as it melts at a cherry red heat, it is easier to form it by casting than by welding. Bismuth and zinc are also included in the same class; but they are so very brittle near their fusing points that no one would think of attempting to weld them either by hammering or pressure.

Iron, in welding, therefore, only follows the example of water. The careful comparative study of these two bodies, even though at first sight apparently so dissimilar, cannot fail to furnish, for this reason, results of great interest to the metallurgist. M. JORDAN.

NOTE.—The work of the puddler is also based upon the same phenomena as that of welding. When the puddler forms his ball in the furnace, it is done by rolling together or aggregating the crystals of iron as they form in the mass of melted iron and slag. In other words the semi-fused crystals are welded or regelated together by the mechanical action of the puddler.

PAPER FROM PEAT.—M. Bertmeyer has recently exhibited, in the Polytechnic Society of Berlin, specimens of paper and pasteboard obtained from the products of the peat beds about Konigaberg, the quality of which is said to be excellent. The pasteboard was 2.4 inches thick, and sufficiently hard and solid to admit of planing and polishing. The paper made from peat alone was brittle, like that manufactured from straw; but the addition of fifteen per cent. of rags produced the requisite toughness.

Extraordinary Welding.

We were shown on Monday last a very interesting specimen of blacksmith work—a bar of Bessemer steel to which five different kinds of iron and steel were perfectly welded, without changing its shape in the least. The bar was rolled into form at Thompson's steel works, in Jersey City, and is one-half by two and a half inches in the cross section. The welds were all made with Schierloh's Cherry-Heat Welding Compound.

First, a piece of Bessemer steel, cut from the end of the bar, was welded fast to it again, the heating and welding occupying eight minutes.

On the reverse side of the bar a piece of fine cast steel was welded in six minutes. Further along on the bar a piece of blister steel was welded in eight minutes. This same steel cannot be welded with borax, as the high temperature needed with that flux makes it as brittle as cast iron under the hammer. Opposite this a piece of wrought iron was welded in six minutes, and further along on the bar a piece of cast iron was welded in three minutes. This was a piece of the mold board of a plow. The bar, with its additions, was then ground and polished on the edge, so as to show the points at which the welded metals came into contact.

No weld was visible on any one of them, and the difference in the metal could only be told by the color after polishing. This solves a great many important problems in iron manufacture, among others the welding of Bessemer scrap, the re-rolling of Bessemer rails, and the manufacture of iron rails with steel heads. We speak advisedly in this matter, as we have personally determined the strength of the welds made with this compound by careful and thorough mechanical tests.

CURIOUS PROPERTIES OF SAND AND ITS POSSIBLE APPLICATION.—It is said that if a quantity of dry sand be placed in a box of thin sheet iron or even in a canvas bag and subjected to a slight compression, it forms a mass capable of resisting a pressure of fully 60 tons without breaking or even straining the envelope. The sand, however, remains perfectly divisible, so that if a small hole be made in the box or bag it will flow slowly and with such little force that even a small piece of paper pasted over the opening will check the flow, even with the 60 tons weight upon it. M. Beandemonlin, a Frenchman who discovered this singular fact several years ago, has recently suggested several possible applications to which he thinks it may be put; the practicability of which, however, may be considered quite problematical. He thinks it might be applied for building purposes, since the filled bags or boxes need merely be held in place by a framework; while being very thick they would form a protection, in case of being used for dwellings, against variations of temperature. Such walls, beside, would be fireproof. It is also suggested that for lowering heavy weights or even entire buildings, which, by a change of street levels, have become located too high above the roadway, the sand bags could be placed beneath and their contents allowed gradually to escape, thus letting the load slowly settle down.

WELDING INSTEAD OF RIVETING FOR BOILER PLATES.—We understand that the cherry heat welding compound is about to be tested in boiler work. It is proposed to lap weld boiler plates, by putting a ribbon of sheet steel between, and heating the edges with a blow pipe. Should the experiment be successful, riveting may be entirely dispensed with, and better boilers will be produced at a cost much below that of riveted work. We have given this matter editorial notice because of its great practical importance to many branches of the iron and steel manufacturing trades. A welding compound which, of our own knowledge, we can say will perfectly unite wrought iron, cast iron, cast steel, blister steel, chrome steel, Bessemer steel and malleable cast iron, each to any other, at a cost so low as to effect an important economy over borax in such operations as are possible with that substance, is certainly destined to effect a radical change in many departments of metal working.

STEAM NAVIGATION.—When steam navigation began, the wildest speculations were indulged in as to speed; but all of them were doomed to be falsified by the results. With the host of improvements yearly adopted, the original speed of eight miles per hour has scarcely been doubled. On the average it has not; the fastest ocean-going steamers only accomplish fifteen miles. In smooth rivers and in narrow channels much higher rates of speed have been obtained; but the average of all kinds of steamers, river and ocean, is from twelve to sixteen miles an hour, and the problem that still vexes engineers is how to obtain a much higher rate of speed. When that will be solved no one can tell; the ocean is a mighty monster, and will not readily be subdued.

UTILIZING SCRAP STEEL.—At the Delamater Iron Works, New York, the scrap steel which accumulates about the shops is utilized in a very simple and economical manner. A pile of mixed steel is made, with a proper quantity of the welding compound sprinkled between the layers. The pile is then brought to a red heat, and worked into shape under a steam hammer. Mr. Crohns, foreman of the smith shop, says the welding is invariably perfect, and that the only objection to the scrap steel for tools is that, in making the piles, bits of steel of inferior quality sometimes get in, which are not suitable for the edges of cutting tools. With more care in selecting and piling the scrap, this difficulty could be entirely avoided.

Mining Stocks.

The mining share market this week has been quite lively and tranеactions have been large. Pricee as a general thing hаve ruled high and no collepse is yet apparent. The Comstock continues to receive the most attention, and the mines outside of that district are at a disconnt. The summing up of the profits of the mines dealt in at the Stock Board for this year is qnite satisfactory. The assessments levied duriug the year amount to $6,777,000 and the dividends foot up $11,625,000. The Crown Point mino hes paid this yeer, $3,400,000 in dividends, making a total of $10,860 000 for the past fonr years. Belcher has paid $5,304,000 this year, making $14,248,000 for the past three yeare. This makes a total of over $25,000,000 distributed by theso two minee in four yeare.

With respect to the developments on the Comstock, the *News* of last Saturday says: Ae to the great new bonanza of the Consolidated Virginia and Ophir it continues looking better and better as further developed. A full realization of ite actual worth seems impossible and wild and unreasonable as the preseut estimates appear, they may not be dcemed so at all in a few months from now. In Consolideted Virginia the great ore body wideus out greatly as it goes toward the California. The eouthermost cross-cut east, at the 1500-foot level of the Consolidated—232 feet from the Californie line—hae reached the east wall, aud ehowe the ore body at that point to he 150 feet wide, and generally rich throughout. The next cross-cut east—132 feet from the California line—was iu 225 feet last evening, nearly the entire leugth iu the richest kind of ore, and the face coutiuuing in the same, with no signs of an east wall as yet. The third cross-cut—and the richest of all—ie ouly fourteen feet south of the Californie line, and is in 45 feet this afternoon, ehowing, if possible, richer and richer as it advances. The same may be eaid of the drift south from the Ophir winze, 1465-foot level, which is now runniug into the California at the north end.

COMING DIVIDENNS.—The Virginia *Enterprise* says: There was paid laet week in San Freucisco, $1,000,000 in dividends from mines. Thie ie almost or quite all from Comstock mines. Next year there ought to he, after paying all expenses, a dividend like that every two weeks. The result will hardly he felt in Nevade, but it must eventually tell wonderfully iu our sister State.

MINING SHAREHOLDERS' DIRECTORY.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco.

SHASTA COAL M. Co. —Dec. 12. Location: Shasta county, California. Directors—Jas A. Pritchard, H. H. Haight, C. T. Wheeler, M. H. Peck and J. C. Kinkead. Capital stock, $5,000,000, divided into 50,000 shares.

SOUTH JEFFERSON M. AND M. CO.—Capital stock $5,000,000, divided into 50,000 shares. Directors—Richard Honefray, A. Rottanzi, C. Steffani, H. Steffani and E. V. Sutter.

COMSTOCK M. Co.—Dec. 14. Location: Virginia District. Capital stock, $10,000,000, in $100,000 shares. Directors—Charles E. Comstock, Henry E. Greene, Charles F. Kirchener, Chas. G. Ewing, and J. Howard Smith.

WESTERN DEVELOPMENT M. Co.—Dec. 15. Object: Carrying on the construction, manufacturing, mining, mercantile, mechanical, banking and commercial business in all their branches. Directors—Frank S. Douty, Edward C. Wright, John Miller, Henry K. White, and Frank C. Ross. Capital stock, $5,000,000.

NEWARK TOWN AND LAND ASSOCIATION.—Dec. 16. Location: Alameda county. Directors—Oliver Eldridge, Henry F. Williams, George A. Worn, John Rosenfeldt, H. W. Byington, Charles R. Peters. J. B. Robertson, James Crank and G. H. Thompson. Capital stock, $750,000, in 25,000 shares.

MILKMEN'S AID AND PROTECTIVE ASSOCIATION.—The purpose of the corporation is "to enable its members to buy feed, stock, and everything they consume; to protect its members from wrong from their employes and the persons with whom they deal; and generally to protect each other in everything relating to their business. Directors—E. H. Knight, J. A. Shepston, J. A. Roy, A. D. Miller, G. C. Smart, and F. L. Such. The Association has no capital stock.

THE coinage of the Carson Miut for November amounted to $462,069.09.

Meetings and Elections.

GOLDEN SUN G. M. Co.—Dec. 14. Trustees—L. S. Henry, A. E. Ball, Dorville Libby, Joseph Pentecost, Wm. B. Lake and Samuel H. Sbeplar. At a subsequent meeting of the Trustees, S. H. Sheplar was elected President, L. J. Henry, Vice-President, Dr. Libby, Treasurer, and Jos. Pentecost, Secretary.

SPRING VALLEY WATER CO.—Directors: Charles Webb Howard, Charles E. McLane, Oliver Eldridge, William Norris, A. B. Forbes, George W. Grannies, D. J. Staples. Charles Webb Howard was elected President, and Charles E. McLane Vice-President of the Board.

EXCELSIOR QUICKSILVER M. Co.—Dec. 14. Trustees—C. D. Morrison, Fred'k Clay, J. Shroufe, R. Von Püster and J. E. Griffiths. The Secretary presented his report, showing that the company did not owe a cent, and that the furnace would be ready to run through ore on the first day of January. The superintendent reported the mine looking splendidly, and that they had about 300 tons of ore out ready for the furnace. Directors—C. D. Morrison, President; J. Shroufe, Vice-President; Fred'k Clay, Treasurer; R. Von Püster, Secretary.

THE new rolling mills at Laramie, Wyoming, will embrace the manufacture of steel as well as iron rails. It is proposed to manufacture all the iron required in Nabraska and Kansae, and all the territories west to the Pacific States.

THE Trinity *Journal* says that the miners of that county are complaining that there hae been no snow on the mountains. They are becoming fearful that there will he a lack of water next year.

THE first engine whistle eounded at Panamint on the 11th inet., and announced the starting up of the steam rock-breaker.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALAMEDA COUNTY.

LIVERMORE COAL.—*Enterprise*, Dec. 12: The work on the Livermore coal mine is progressing slowly but surely, and to the general satisfaction of the owners. The main vein hes not been etruck yet, but it ie expected that it will he withiu the coming week.

COAL AT SUNOL.—Cor. *Enterprise*. There are four men at work on the coal mine, recently discovered about 4½ miles east of this station. About 100 pounds, taken at a depth of twelve feet was sent to San Francisco for the purpose of tostiug its quality. The result is that it hae proveu oue of the best coal discoveries yet made in the State. The approach to thie future mine ie a most excellent one, though over a seriee of hille. We are informed that the vein is now two feet in thicknese and every indication of expanding as the workmen progress in sinking upon it.

CALAVERAS COUNTY.

RICH ROCK.—*Chronicle*, Dec. 12: We saw some very rich quartz, receutly, taken from the Austrian mine at Jeeue Maria. We understand that the entire ledge is gold-bearing and will pay largely. The company owning the mine has a good mill whicb ie to be set at work as soon as practicable.

THE BLAZING COMET.—*Citizen*, Dec. 12: This mine, on the banke of the North Fork, owned by Brigge & Co., had a crushing last week which rumor says, paid $3.50 per cargo.

SANDERSON MINE.—Au 18-inch vein of excellent ore is uow being opened at thie mine. The ceeing of slate is very hard, but the richnese of the ore warrants the opinion that the mine is to contiiue a workiug success.

JOSEPHINE MINE.—A company of capitaliets are in possession of the Josephine and with a superintendent on the premises they propose to satisfy themselves as to the worth of the mine. All necessary arrangements are ahont coompleted for sinking the main shaft and teeting the body of ore which is known to exiet. Formerly this mine was worked and yielded as rich rock as any mine in the district, and if it continues as good ae is anticipated, machinery will be put up in the spring. Both extensions of the mine are being worked and give satisfactory resnlts.

ZACATARA MINE.—We are informed that the new superintendent proposes to make a success of this mine. The embarrassing debt under which it hae rested for eeveral weeks, it ie said will be paid off within a few days, and then active operations will be resumed, both above and helow gronnd.

INYO COUNTY.

ARGUE DISTRICT.—Inyo *Independent*, Dec. 5: Quite a number of recent mining locations of the Argus District have been recorded at the County Clerk'e office during the present week, indicating some activity in that direction. The district is situated south of Coeo and west of Panamint.

PINE MOUNTAIN.—Messrs. Broder & Moffat are in receipt of the news of a valuable etrike in their mines in Pine Mountain District.

THE KEARSARGE.—It is gratifying to announce the fact that, after so long and uncalled for idleness, a force of miners are to be immediately set to work on the Kearsarge, ae a prospecting force, preliminery to the overhauling and etarting up of the mill. During a recent call at thie office, Mr. Gray, the principel owner of the property, assured us of his entire confidence in the extent and richness of the miue.

EXTRAORNINARY SPECIMENS.—In the "Days of Forty-Nine" they doubtless exhibited many fine nuggets or gold specimens of great value, but we fancy there were not many excelling in beauty or size that on exhibition at V. Hoff'e store, in Lone Pine. It is a specimen of solid gold, weighing 11 ouncee. It is flet, about half an inch thick, one and one-half by two inches in breedth, and worth $360. Messrs. Harris and Rhine, of this place, recently shipped to the mint a nugget from the same mine worth $645.60, weight 48 onnces, the value per ounce being nearly $13.50. Several smaller pieces of like character are now in their hands. They are from the placer minee near Gold Mountain, owned hy some Mexicane whoee nemes we were nnable to learn.

PANAMINT ITEMS.—Panamint *News:* J. H. Croesmau, of San Francisco, and J. W. Whitlack, one of the pioneere of Panamint, have purchaeed of Mann & Morgan the Towaude mine, situated on the eonth eide of Marble canyon. Crossman is interested with a uumber of heavy capitaliete of San Francisco, and it is their intention to commence a thorongh development of the several mines they have already seoured, and introduce the latest and best machinery with which to accomplish that object.

THE S. V. M. & W. Co. have about finished laying the long striug of iron pipe from the spring near the company's store down through town to Jacobs' mill, which ie thue to he supplied with water, the pumping machinery for the deep well at the mill not yet heving arrived.

PARTIES have come in during the past two or three days bringing rich specimene and glowing accounts of three new districte discovered, one of which is said to he off to the eouth-east, another to the north, and the third in the

Argns range, on the west side of Panamint valley.

The Jacohs' mill is to bsgin its first run about next Monday. This run will be bnt short, tbs objebt in view in this start being merely to demonstrate the value of Mr. Jacobs' system of concentrating the ores. Some important operations are contingent upon the degree of success attained in this experiment, if it can be called such.

MARIPOSA COUNTY.

Coultexville and Vicinity.—Mariposa *Gazette*: Under date of December, 1st, our Conlterville correspondent, "Waif," writes that the mining interest on that side of the river is steadily improving, and everything connected therewith seems to be progressing finely. The Hasloo and Banderita are both running to their full capacity on good ore, and, judging from former workings, the resnlts are likoly to be satisfactory.

A portion of the machinery for tbe Martin & Walling mine is on the ground, and teams are on the road for tbe balance. The machinery is first-class.

MONTEREY COUNTY.

Coal Discoveries. — Monterey *Democrat*, Dco. 12: In the hills, about 1¼ of a mile due east of the claim of the Monterey Coal Co., further discoveries of coal, or coal signs, are reported. Shales, such as accompany coal, are fonnd in quantity, giving rise, hy their thickness and position to the belief that they indicate the presence of an extonsive body of coal. Upon the basis of this discovery a new company has been formed, and, as we suppose, we may look for speedy development from their action.

NEVADA COUNTY.

Omaha Mine.—Grass Valley *Union*, Dec. 1:0 This mine is not oaly doing well, but yesterday it did better than ever. In the drifts there is a ledge three feet thick, and it shows rich ribbon quartz, free gold being distributed all through the rock. In the shaft there is very fine pay rock.

Bio Wheel.—Yesterday tbo big crown wheel for the Idaho mine arrived in town. It was loaded on one of the strong and broad tired trncks belonging to the Mohawk Lumber Co., the only vehicle in these parts that would bear it np. The wheel weighs about ten tons, and it took 22 animals—10 horses and 12 oxen to draw it over from Colfax.

Magenta Mine.—Work in the Magenta mine is being rapidly prosecnted. The miners are sinking the main shaft for the 400-foot level. Tbe ledge in the shaft is ahout 20 inches thick, and shows free gold. The shaft is down about 365 feet. A crushing will pay the lessees good wages, after deducting the percentage due to the owners of tbe mine. The ledge is well defined and between good walls.

Gold Run Mine.—*Transcript*, Dec. 12: The incline of the Gold Run mine is down 208 feet. The work of sinking is going steadily on, and everything is working like a charm. The formation between walls is 18 inches, and there is 12 inches of solid quartz. It carries a great deal of sulphnrets, and tho rock looks well.

The Omega mining company, we understand, has started to work. The proceeds of that mine the coming year is expected to be immense. It is one of the best in the county.

The Manzanita mine is just a hooming now. The amount of water running down the flume under the Union hotel looks liko a small-sized river.

The California mine is looking its best now. The levels open out well, and the Superintendent, Mr. Holland, informs us the rook is paying splendidly.

Fine Rock.—Grass Valley *Union*, Dec. 11: We saw yesterday some very fine rock from the New York Hill mine. The quartz from that mine has lately and geaerally worked by mill process up to $60 per ton, not including the snlphnrets. The next crushing will be much better. The New York Hill mine is very promising.

The Milton ditch is at last through. The connection was made last Saturday. The source of the ditch is now on the divide between here and the State of Nevada, at a place called Milton, and penetrates the country that has snow on the gronnd ten months ont of the year. By this connection the water snpply ie increased hy 2,000 inchee, and on Saturday last, immediately after the water snpply was turned on, four hydraulic claims that have been compelled to quit washing because of a lack of water, commenced work, and are now getting out the twenty-dol ar pieces. The ditch company expect to be able to supply all demands for water hereafter.

Deanman's Flat.—About two and a-half miles south of Grase Valley the above flat is situated. It has many quartz ledges and some of them have been proven to be very rich. The Pittsburg owned by the Cook Brothers and E. P. Sanford is a newly-worked ledge, yet the profits have been sufficient to pay all the expenses of opening it, and pay a handeome dividend besides. There is no machinery on it except a "whim," worked by horee power. We learn that a "crnshing" is being worked now, at Larrimer's mill, and that it will produce eight or ten thousand dollars. The rock from the flat has all to be hauled two or three miles to he crushed. A qnartz mill on the spot would pay well hy crushing custom rock, and would stimnlate proepectors. It is one of the best fields for the prospector in the county, and will ere long he proven to be a very rich mining section.

PLACER COUNTY.

Goln Run.—Cor. Placer *Herald*, Dec. 12: The miners have all been hard at work for some time past, and even if tbe water shonld dry np now, as the present fine weather indicates, they will be able to make quite a handsome clean-up before Christmas. Mr. J. B. Taylor, I understand, has sold out his claim to the Miner's Ditch company. The big tunnel is still progressing at a rapid pace.

SAN BENITO COUNTY.

Another Mine.—*Advance*, Dec. 12: We are informed that abont two weeks since Mr. Gonld, engineer of tho S. P. R. R. company, passed through Panoche valley en route to a newly discovered quicksilver mine, said to bo located 11 miles south of New Idria. The deposits are said to be rich in mineral ore, and a company of San Francisco men are interested in the prospect and are about to incorporate.

SAN LUIS OBISPO COUNTY.

Cambria Items.—*Tribune*, Dec: 12: The furnace on the Oceanic mine has been completed and the fires started therein to dry the interior preparatory to charging with ore, the reduction of ores will commence in a few days. It is tho calculation to turn out at least 500 flasks of quicksilver per month. Oceanica No. 2. This company has duly consolidated their claims and perfected an organization. Work will be commenced next week and everything bids fair to make it as valuable a property as tho original Oceanic. Oceanic No. 2, comprises the claims immediately adjoining the Oceanic on the east, and is situated on a higher point of the mountain. There are excellent surface indications, the property is in a direct line of the lode as shown in the works of the Oceanic.

North Star. This company intend re-commencing active work, with a view of opening what is considered one of tbe best miaes in the district. The main tunnel is now in 156 feet and directly under the heavy rich surface croppings. Allowing for dip of ledge, it is believed that 40 or 50 feet more will cut the deposit. Fair indications are now perceptible in the tunnel. The Mercury company will issue stock in a few days and commence a systematic attack on what is believed to be a rich mercurial stronghold. The company own 7,500 feet and hold a quit claim of the patentee of the land.

TUOLUMNE COUNTY.

Lany Washington.—Tuolumne *Independent*, Dec. 12: Mr. Fred Grainer, an old experienced qnartz miner, has been appointed superintendent of the Lady Washington mine. The new engine of a ten horse power for the hoisting works has been put in readiness for the work. They have come npon $25 and $30 rock 150 feet from the surface, and if it holds out 300 feet further, the distanço they propose to run it. it will prove a mine of great value without donbt.

The water came in to Columbia on Saturday night, and the miners there and thereabouts went to work on Monday morning. Repairs and hresks along the line of the ditch have been the cause of no water for some time past.

Shaw's Flat.—Mr. J. Potter, of Springfield, has discovered a vein of rich quartz on his ranch, which appears to be well defined, and running in an easterly and westerly direction. He is now sinking a prospecting shaft on the vein, where it crosses the Shaw's Flat road, about one-eight of a mile south of Springfield. He is down on the vein 30 feet from the surface or croppings. At this depth it is three feet in thickness.

New Marble Discovery.—A marble discovery has been made by W. G. Loag and J. P. Dart on Turnback creek, one mile below Roache's camp. It has the appearance in places of being 150 to 200 feet wide. It crops ont in hold relief—the face being a perpendicular bluff 500 feet high from the bottom of the creek, giving an excellent show to work and open a quarry. The color of the marble is white, blue and white and a flesh color, and is susceptible of a high polish.

Nevada.

WASHOE DISTRICT.

Con. Virginia.—Gold Hill *News*, Dec. 10: The north drift, on the lowest level, is advancing rapidly in fine ore. Work has lately been greatly retarded on this level (1550 foot), in consequence of having to retimber a considerable portion of the drift. From this level, the winze to the 1600-foot level, has already been sunk to that depth, and ie still continued in the very finest ore yet disclosed in the mine. This ore is compact, very hard, and contains a little water which seeps through the rock freely. On the 1500-foot level the developments in the ore body are exceedingly encouraging. The ore breaste on the 1300 and 1400-foot levels looks well and are yielding handeomely. No ore has been stoped out yet below the 1400-foot level. All that has yet been taken from below that point is what comes from the prospecting drifts and winzes. It will require several weeks time to complete the opening drifts preparatory to breasting out the ore, by which time the new mill of the company will he in readiness to turn out bullion. This accession to the milling capacity of the company will enable it to make increased returns to the stockholders.

California.—The cross-cut east from the Consolidated Virginia shaft, 14 feet south of the California line, is now in 44 feet, with the face still in the richest kind of black sulphuret ore, which assays up in the thousands. The drift from the Ophir, 35 feet below the 1465-foot level, is into the California ground, and shows ore of asimilar rich character; and at the 1400 and 1500-foot levels cross-cuts are being made which will develop the valne of the ore body in the California, very shortly. Experts continue enthusiastic as to the extent and richness of the great bonanza, and their figures prognostications as to the amount of ore in sight, and what it will yield are simply fabulous.

Ophir.—Daily yield 250 tons of ore, from the 1300 and 1400-foot levels. The ore breasts at and between these two levels show an immense amount of rich ore, and the drifts and cross-cuts of the 1465-foot level, are all in rich ore. The ore body at that point is fully demonstrated to be of great depth also. It evidently is a portion of the great Consolidated Virginia and California ore body, and not only widens, but extends farther north as greater depth is attained. Great expectations are justly indulged in as to what may be developed in cross-cutting at the 1700-foot level. The air connections, by means of winzes from the upper to the lower levels and connecting with the drift running through the California to the 1500-foot level of the Con. Virginia, gives a splendid circulation of air, so that work goes on very comfortably.

Belcher.—Daily yield 450 tons of ore from the old working levels. The ore breasts hold out well, and will for a long time to come. The development of the 1500-foot level is actively going ahead, the cooler weather furnishing better air, and the chances for fining more good ore at that point are very encouraging. The main incline is now down 59 feet below the 1500-foot level, and the drift started from the station to open the level is getting along well.

Lany Bryan.—The main west drift at the 250-foot level is now in 137 feet, and is evidently about catting the vein. This will cut into new unprospected ground, where something good is expected.

Sierra Nevada.—The mill is kept steadily supplied on ore from the mine, principally from the old upper workings. The good ore development found in the north drift from the old tunnel, is showing finely, and the general prospects of the mine are excellent.

Caledonia.—The air winze from the 900 to connect with the 1000-foot level is now down 97 feet, and good progress is now being made, the ground working favorably.

Phil. Sheridan.—Main west drift in 113 feet to-day, with the whole face in clay, quartz and porphyry, which, with a slight increase of water gives indication of closer proximity to the ledge. This mine being located immediatcly adjoining the Sierra Nevada, on the north possesses more than an ordinary interest at the present time, owing to the immensely rich developments made in Ophir, and other mines in its vicinity.

Florida.—The new hoisting machinery has been started into operation and runs splendidly. The building is nearly finished. Drifting west for the ledge is commenced at the 300-foot level, which is 45 feet above the bottom of the shaft. Good stringers of low grade ore already met with in the face of the drift.

Imperial-Empire.—Main south drift, 1850-foot level, still being driven ahead toward the Yellow Jacket line, and the south winze continues in ore. The drift at the 2000-foot level is also driven ahead, but the air in both this drift and the winze above mentioned is hot and not good.

Yellow Jacket.—The main incline is being actively sunk for another level, and is to-day 100 feet below the 1740-foot level, in favorable working ground. The 1740 is the present lowest working level, and from it a drift or cross-cut east is being made, which is now in 150 feet.

Crown Point.—Daily yield, 500 tons of ore from the 1400 and 1500-foot levels. The ore breasts continue looking and yielding well, regardless of the price of stocks. The development of the 1500 and 1600-foot levels is actively going ahead, and new discoveries of ore, in addition to the extensive deposits already existing and being worked, are daily anticipated. It will take years to work out the ore bodies already found in this famous mine.

Daney.—In the main drift west, at the 400-foot level, such a heavy increase of water has been encountered, that work at that point had to be stopped night before last. The ledge is found to be about 190 feet wide.

Knickerbocker.—Everything about the mine going on as usual. Drifting at a rapid rate toward the ledge, both from the 600 and 700-foot stations.

Bullion.—The good ore prospects found in the south drift of the 800-foot level continue, and good assays are obtained from the occasional bunches of quartz met with.

Savage.—The main incline is still progressing deeper, with its bottom in hard blasting rock. The heavy masonry foundations for the new engine are being laid, and the building over it is in process of erection.

Chollar-Potosi.—Daily yield, 45 to 50 tons of ore, which aceays about $28 to the ton. Cross-cutting at the fifth etation level develops nothing new and important as yet.

Leo.—The ore veiu in the face of the main tunnel, continues strong and well defined and carries some very good ore.

Senator.—The west drift of the 400-ft. level has cut into eoft ledge matter a distance of 18 feet, from which assays of from $18 to $35 to the ton are obtained. This goee to show that pay ore ie to be found east of the Comstock.

Succor.—The rock at the bottom of the main sbaft is softer and works better, allowing of better progress being made in siaking.

Rock Island.—Some very fine looking white qnartz, filled with sulphnrets, is coming from the winze in the east vein.

Woonville.—The ore breasts of the 200 and 300-foot levels are yielding the nsnal amount of good ore, keeping the mill running steadily.

Sutro.—The vein of low grade ore cut into last week continues looking better as further developed, and gives assays as high as $20 to the ton.

Hale & Norcross.—The northwest drift at the 2000-foot level is now in 159 feet, the vein matter still continuing, and no east wall as yet.

Baltimore Consolidated.—Water troubles very much, taxing the hoisting tanks to their utmost capacity. The heavy, new pumping and hoisting machinery ordered will be here in a few weeks.

American Flat.—The winze at the 450-foot level is in good ore, which gives high assays, and is estimated to be 50 feet wide.

Mint.—Shaft sinking in good working ground with excellent progress.

Gould & Cuary.—The water is not quite drained sufficient to alllow of explorations at the lower levels to be resumed, but the pumps are working very effectively.

Arizona.

Mining Items.—Arizona *Miner*, December 4: This is splendid weather for mining; water everywhere; weather just right for our heroes of the pick and shovel.

Yesterday, in a trip around town we called at the several stores and were shown gold to the value of $5,000 for which they had traded in a very few days.

In Big Bug district, Jos. Faut and his partners are extracting very rich ore from the Silver Belt mine. Mr. Hitchcock is running arastras with his water wheel and many other miners are placer mining, taking ont ores, etc. Not less than 100 men are at work on the Upper Hassayampa.

Noyes' ten-stamp mill is crushing silver ore.

Bill Smith's ten-stamp mill is crushing the richest Vulture ore ever yet worked.

Lynx creek is alive with miners who are taking ont gold with arastras, slaices, and by the hydraulic process.

The General Crook mine is yieldiag its vast treasnres at the rate of $200 per ton.

A new and rich ledge was recently found near tho Crook hy a Mr. Moore. Hurst & Co. are constructing arastras and a watsr wheel to run drag rocks. This ledge is said to be large and promising.

Idaho.

New Company.—Idaho *Statesman*, Dec. 5: Mr. John L. Tillman, of Rocky Bar, is in town and paid us a visit yesterday. Mr. Tillman is one of the old pioneers of Alturas county, and to use a miner's phrase, "he is a powerful good rustler." He went east about a year ago and formed a mining company in Buffalo N. Y. their superintendent Mr. Cavanah is now at Rocky Bar pushing their work on the mines while Mr. Tillman goes east this winter to procure machinery.

Montana.

Mr. R. McMind, of American Bar designs putting a Little Giant on his mine next season.

Parks, of Butte, has just commenced taking out ore from the Parrott lode under contract of the Helena First National Bank.

P. Brogan, of Yreka has bought out the interests of his late partner Mr. Kentedy, in Elk Creek for $8,000 and now has 5200 feet of ground in the gulch.—*Missoulian, 25th inst.*

J. W. Rankin, with a force of hand is engsged in getting out timbers for the new bridge over the Bitter Root river near Stevensville.

The excitement consequent upon the rich iscovery on Nine-Mile continues nnabated.

Shippino Quartz. — Helena *Independent*, Dec. 4: We are credibly informed that some of the qnartz owners in the vicinity of Bannack, among them the Peck Bros., are now shipping their ores to Utah for reduction. They have heretofore shipped to San Francisco, Newark, Swansea and Omaha, but a recent shipmeat to Salt Lake demonstrated that they could do the best the nearest home. During the coming season there will he several hnndred tons of ore shipped from Bannack to Salt Lake for reduction. By shipping to Utah returns can he had in from 35 to 45 days, while to other points it requiree from three to six months, and the result is that not only those miners who possess considerable capital can afford to ship to a distant point.

Oregon.

Mining Items. — *Oregonian*, Dec. 5: The mines of Eastern Oregon expect a good season next year from tho way the winter has started in.

J. W. Virtue, of Baker City, is preparing a cabinet of minerale for exhibition at the Centennial Exhibition.

A rich deposit of coal has been found on Long Tom, a short time ago.

Our Baker City correspondent thinks there is enough mineral wealth about that place to make a city rich as Palmyra of old. The mining in that county is yet in its infancy.

The Ironetone Quartz mine in Baker county is looking better the further down it is explored. The Virtue mill ie pounding away on good rock. The owners of the Summit mine are taking ont good rock and will continue throngh the winter.

The Jacksonville *Sentinel* says: "Prospecting for cinnabar is the exciting pastime of the loose-footed in thie region. Rich ledges are supposed to he near here as much rich float ore is picked up by miners. The existence of some ledges is demonstrated."

Extensive Gravel Mining Operations.---The North Fork Company's Claim.

In our last week's issue we published a description of the ditch and pipe which have been constructed this season by the North Fork mining company. This week we copy from the Plumas *National* a description of their extensive and valuable claims.

The mining ground consists of the claims known as Cummings' hill, Dutch hill, Barker hill and Owl hill. These mines have been worked more or less during the last twenty years, but the facilities at the command of the owners of these claims were so poor that little was accomplished. Sufficient work was done however, to prove the value of the ground in the different claims. Lying contiguous to, and in such a position that our ditch would cover the ground in each of the claims, the North Fork company, purchased the whole ground from the different owners, and in February last made application to the U. S. Government for a patent to the same, giving the claims thus consolidated the name of the North Fork Placer mine, and claiming in the application, 371 17-100the acres. Since the application for patent the company have taken up and bought claims adjoining their mine to the amount of nearly 500 acres, and have now, in all, about 800 acres of mining land in one body, lying from 200 to 500 feet under their ditch.

The first of these claims that is reached by the ditch is Cummings' hill, which was purchased from Mr. Myron Wagner, the company's present superintendent. This is the highest ground within the boundaries of the North Fork mine, some of the gravel being a hundred feet above the line of the ditch. This, however, will be worked by water pumped from the ditch. For this purpose the pump and engine now at Ohio valley is to be used. The pump is capable of raising one hundred inches of water to the hight of two hundred feet. The gravel at Cummings' hill is very rich. Until the water was brought to the ground by the Ohio creek ditch the claim was worked by drifting, and the dirt hauled in carts to water caught in a reservoir, and fed by a small spring affording only a few inches of water. Even by this slow process as high as $1,000 per day has been made, and our informant has seen $110 washed from a single load of dirt, hauled to the water in a hand-cart. By this mode of working, consequently, very little ground compared with the immense body in the hill, has been worked. Considerable gravel taken from Cummings hill, and not considered sufficiently rich to pay for carting and washing, has been dumped at the face of the works, and will now be washed and pay good wages.

Dutch hill, the next claim on the line of the ditch, was purchased by the company from Julius Catsuna & Co A considerable amount of this claim can be worked by piping, but it is more properly a drifting claim. Three bed rock tunnels have been run on this ground, one of which goes into the hill from the south, and dumps into Barker ravine; the other two enter the hill from the west, and dump into Owl creek. The last tunnel run, one of those dumping into Owl creek, is the main tunnel of the mine. It is now in a distance of 700 feet, and has been run by the North Fork company since they came into possession of the mine. The work on this tunnel was commenced nearly a year ago, and was run a considerable distance by hand drilling, the miners making about two feet per day in bed-rock; but one of Wood's steam drills has been used during the past summer, which averaged five feet per day. The motive power used was Ericsson's new air condensing engine, the only one, we believe, on the coast. The main drifting ground in the Dutch hill claim is about 1,400 feet wide, and ten feet deep between the lava-cap and the bed rock. Where the gravel has been reached and worked, it has proved exceedingly rich, paying as high as an ounce per day to the hand. This gravel is capped with lava, and the tunnel is through solid bed-rock its entire length, tapping the gravel at what is supposed to be the lowest point in the channel.

Barker hill, to the east of Dutch hill, is the last point reached by the ditch. This is a fine body of gravel, similar to that in the Badger, Gopher and Hungarian Hill mines, near Quincy, and was purchased by the company from Mecklin & Co. This ground is easily worked, and is very rich. On the greater part of Barker hill a pressure from the ditch of 200 feet and over can be used. The old Ohio creek ditch reached this claim, and while water lasted in it—which was only about 200 inches for a month or so in the spring—the claim was worked. Last spring the present proprietors laid a flume up Barker ravine to bed rock in this claim, and, using a Little Giant machine, worked off considerable ground with such good results that they feel confident of cleaning up $1,000 per day with proper machinery, and the water which will be rendered available from the new ditch. Besides the ground within the boundaries of the old Barker hill claims, about two hundred acres of a gravel flat lies below it, which the company has already located or otherwise secured, and which is now, with this new water privilege, rendered very valuable, and will be worth thousands of dollars per acre.

Owl Hill lies off the line of the ditch a short distance, and a branch ditch to cover the ground will have to be dug. The company at present do not intend doing anything with this claim, having sufficient ground immediately below the ditch to keep them busy for years to come.

With this immense body of splendid gravel, and with all the modern improvements in hydraulic mining to aid them, it takes but little wisdom to predict that the North Fork company will realize a very handsome profit for their investment. The work already described is not the sum total of their outlay, as it was found necessary to construct roads to bring in their freight, and with this and other expenditures, their expenses have been enormous. A new road has been constructed from Bidwell's bridge, in the Meadows by way of Ohio valley, to Dutch Hill and a new road also from Dutch Hill to Butt valley. Freight from below now comes by Humbug valley, thence to Butt valley and from there to Dutch Hill. The old road is by way of Prattville, and the new one saves some ten miles of travel. The company have also put up a store at Dutch Hill and stocked it for the accommodation of their miners.

We neglected to mention last week that the surveys for the line of ditch and pipe were made by our County Surveyor and townsman, Mr. A. W. Keddie. The line was so difficult to establish that it required over two month's labor with a full surveyor's "crew" to do the work. Good judges of such matters inform us that Mr. Keddie's work is as fine a piece of civil engineering as was ever done in the State, and shows plainly that he is thoroughly posted in his business.

In conclusion we would say that the North Fork company certainly deserve success. Their capital has been invested with a lavish hand, and now, as they draw near to the completion of their labors we are glad that they can safely count on being liberally remunerated.

Juvenile Criminals.

Those who have read the recent criminal records of San Francisco must have been shocked at the accounts published in the city papers a few days since, of fourteen juvenile criminals being under arrest at the city prison on one night; their ages ranging from eight to fourteen years. One of the youngest of these had secreted about his person stolen jewelry amounting to over $150 in value. Among these youthful criminals were juvenile burglars and pickpockets; other departments of crime were also well represented. The "resources of California" in criminal matters are now being developed to that extent that our city prisons are crowded beyond their lodging capacity, and age having precedence here—not out of respect but as a matter of safety—these youngsters were denied ordinary cell accommodations, and were compelled to lie upon the benches out side.

A gentleman connected with one of the morning papers, and who was on duty as night police reporter, in his conversation with us on the subject, characterized the scenes as "sickening in the extreme." It is indeed a sad and sickening sight, and would be appalling did we not know that the capacity for good in human nature is equal to its success in crime; and if people would be satisfied in any case in thanking God that they and their children are not as other people and *their* children, this would furnish as justifiable an instance as could be found. But social Pharaseism is getting to be at about as great a discount as that which formerly went about dressed in a religious garb.

We protest against the scene described above being accepted as a representative picture of juvenile life in San Francisco. Our large and numerous schools are as crowded with bright, pure and diligent searchers after knowledge, as are our city prisons with the graduates of criminal education, and scores of boys of the ages of these youthful criminals, are working regularly at various occupations in large and small establishments, earning money that is judiciously used by worthy families. But this, like much other true merit that is blooming in our midst, is allowed to go without any newspaper record. Suppose, just for a change, that one of our enterprising dailies were to have a school reporter and a workshop reporter, who were required to search for merit in our excellent schools and thriving shops and manufactories, as indefatigably as their brother reporters ferret out vice in its "dives" and other hiding places. Should we not obtain a more accurate picture of the times and the city! in which we live than is given us at present? The popular press is just about as faithful a "mirror of the times" as is the stage; and we all know how the latter has failed in obeying the injunction of the great master to "show virtue in its true image," and has only shown "vice its own deformity."

Great injustice is also done to the girls of San Francisco. There are hundreds of fresh, blooming, promising girls, going and coming to and from their work every morning and evening, receiving fair wages and respectful treatment from their employers, there being nothing in their conduct that would warrant us in classing them below the girls of any city or rural district. But the Simon pure in our midst can see nothing good in them, and the residents of the rural districts and people of the East, seem to possess an insatiable appetite for anything derogatory to "the girls of San Francisco;" and as the press is bound to tell the public what it wants to hear, whether it is strictly true or not, disparaging false impressions continue to prevail.

The broad level of middle life is never traversed by the newspaper reporter. The Stanley's of the press are sent to Africa, and expeditions are fitted out to explore the Polar region, but the vast, prosperous, progressive country lying between these two extremes, is scarcely looked into except to furnish means to sustain these gigantic exploring enterprises. One class of reporters go about like Chinese rag-pickers, hooking filthy scraps from the gutters and dirt piles of society, emptying their huge baskets morning and evening at the doors of a disgusted community. The higher grade of the reportorial corps is commissioned to devote unlimited space to chronicling the movements and describing the trappings of "upstart fortune;" while the only newspaper employees who visit the decent, non-sensational, every-day homes of middle life, where the only reliable representation of the social condition of the country is to be obtained, are the carrier and the bill collector.

Probably this seeming neglect will find an excuse in the very fact that there is nothing sensational in the latter place to write about; but is this expansive mirror only expected to reflect the sensational points of the times? Should it not show us the graceful courses and sweet dimples of society, as well as the unsightly warts and tumors with which it is afflicted, or the untasteful frills with which it bedecks itself? Possibly, too, it is better for the broad land of social life that it thus remains unvisited; but this will hardly be accepted as the reason why it has remained unvisited.

Still there is no denying that these striking points in this sad picture are, in the main, correctly given, though the background is not there; and we could furnish additional facts from our own observation which would make the above sketch of youthful crime still more striking, and we believe that if the subject were carefully studied—divested of its sensationalism—it would result in a conviction that these youthful criminals—and many also of a larger growth—are impelled in their wild doings more by the romance of brigandage than by the desire of pecuniary gain. We believe further that a very large portion of the crimes, as well as the follies that are chronicled so conspicuously in the press of the day, are committed with a view to be so chronicled; and that the American mania for getting its name into print is crowding the criminal departments of American journalism, as uncomfortably as it does the poet's corner, and the columns appropriated to prose fiction and to science. Thus sensational journalism, like jealousy, may be credited with making the meat it feeds upon.

A NOTABLE MINING ENTERPRISE.—Among the many mining enterprises inaugurated in this vicinity during the past year, none excels in importance the re-opening of the old "Red Hill claim," for which preparations are now being made. The claim mentioned is known to be rich, it having been profitably worked for several years by former owners. The great drawback was, however, that water could not be got to the ground, under pressure sufficient for hydraulic purposes, without laying down an iron pipe from the ditch to the claim, a distance of about 4,000 feet. The former owners of the ground were not prepared to go to the necessary expense, and the claim has for some time lain idle in consequence. Quite recently the ground has been purchased by Mr. W. W. Cook of this place, an experienced miner, who is making preparations for working the claim upon an extensive scale. Water is to be conducted to the mine, from the main ditch on Stockton hill, through a 10-inch iron pipe, the distance being nearly a mile. By this means a pressure of 200 feet will be obtained—sufficient to establish a powerful hydraulic. Before washing is commenced the claim will also be put in proper shape for working to advantage, and supplied with all the paraphernalia known to modern hydraulicing. The enterprise involves a large expenditure, but the known richness and extent of the ground to be worked are amply sufficient to warrant that it will be a profitable one. The iron pipe is now being made by Mr. Horace Ray, of this town.—*Calaveras Chronicle.*

O. M. EVANS is working an antimony mine, near Unionville, and making it pay. The mine is situated in the foothills, about one mile from town, in a quartzite formation. It has been developed by a tunnel 300 feet in length. At the face of the tunnel some very rich silver ore is found in connection with a vein of antimony from two to four feet thick. The ledge runs into the mountain in a northwesterly direction, and the ground adjoining is so soft that it costs but four dollars a foot to run the tunnel. From 10 to 15 tons of antimony is shipped from the mine weekly to Starr's smelting works, San Francisco.

THE prospects of the quartz mines in the Salmon country, says the Yreka *Union*, were never more flattering than at present. At the Black Bear there are 32 stamps running, at the Klamath 32, and at the Evening Star 4. The Morning Star Company, whose mine and mill are on Jackass Gulch, expect to start their mill shortly. There is probably not another quartz district in the State in which so large a proportion of the ledges pay.

The Sacramento Beet Sugar Company.

The Board of Directors are H. G. Smith, Phillip Scheld, Samuel Lavenson, W. E. Brown, and Julius Wetzlar. The officers are: President and Treasurer, Julius Wetzlar; Secretary, A. J. Wetzlar. The location of the works is two miles from Sacramento, at the intersection of J street and the levee. The land owned by the company comprises about 700 acres, added to which is 600 acres of leased land, making a total of land operated by the company 1,300 acres. The capacity of the works is 80 ton per day, (24 hours); the yield of Beets, per acre, average 12 tons; the varieties of Beets grown are the White, Sicilian and Imperial. The percentage of saccharine matter averages 12½ per cent, and of first quality Sugar, 5⅝ per cent. The capital invested is $300,000. The cost of machinery was $140,000, that of buildings $40,000, and that of teams, tools, etc., $20,000, making a total of $200,000. The buildings consist of a frame factory 100 by 45 feet; a frame Sugar storehouse 30 by 40 feet; a frame Superintendent's dwelling 20 by 35 feet, 2 stories; a frame boading house 35 by 45 feet; eight frame dwellings 24 by 30 feet; one frame Chinese quarters 50 by 30 feet; a blacksmith shop 30 by 20 feet; three frame granaries, the first 85 by 30 feet, the second 20 by 40 feet, and the third 10 by 15 feet; three large frame cattle stables 100 by 40 feet each; one large frame tool and implement storehouse-shed 20 by 30 feet; and four large frame stables, the first 60 by 30, second 30 by 40, third 35 by 20, and the fourth 60 by 25 feet. They raised their own seed this year, at a saving of $4,500. They formerly imported 10,000 pounds. The cash business for 1873 equalled $190,000, and that for 1874, $300,000. Of the land operated, 385 acres are located in Davisville, Yolo County, Cal. The number of white men employed is 150, and that of Chinese, 500. The company owns its own barrel machinery. The works were in operation in 1873 for five months, and in 1874 for nine months. The machinery consists of five steam engines: No. 1—30-horsepower, square beam, and drives eight pumps; water, vacuum and feed pumps for boilers, gas pumps for carbonic acid gas, and hot water pumps. No. 2—15-horsepower, drives Beet washing machine, elevators and Beet cutters. No. 3—8-horsepower, drives the centrifugal machines, Sugar grinders and the Sugar packing machines. No. 4—5-horsepower, and works the washing machines, elevators and drawing machines. The water is obtained from wells, and the fuel used is wood, of which from 11 to 12 cords every 24 hours are consumed. So carefully has these works been managed, that but one small accident has occurred in two years. These engine works require all the steam that can be generated in three tubular boilers, 48 feet in diameter. A diffusion battery is used to extract juice in this establishment. The process of manufacture is as follows: The Beets are taken out of the ground by a two-tined fork, the heads or green part of the Beet is then chopped off with a large cleaver knife, the Beets are loaded on a wagon, transferred to the cars, hauled to the Beet factory storehouse, thrown into a washer, and at the same time assorted (that is, bad or damaged Beets thrown out), passed from there by an an endless belt with cups to the chopper, chopped into ribbon strips and dumped into the batteries, where steam is inserted; the juice is then forced by water and steam into the bottom of the battery and carried through pipes into a steam drum, forced thence through lime and bone coal into the filterers, returned from there purified into the copper boiler, boiled down to a crystalization point, drawn out from there into tanks, allowed to cool and stand, and then introduced into the centrifugals, from which they come out as pure Sugar, leaving a refuse which is again boiled down and worked over. The Sugar is then taken to the crusher room, either ground or crushed, boxed or barrelled; is then loaded on cars and sent to a ready market.—*Journal of Commerce.*

COPARTNERSHIP NOTICES.—The Healdsburg *Flag* publishes the following, which may prove valuable to litigants: The law of this State is that no firm or company not incorporated, doing business in the State shall have a standing in Court until there shall have been a four weeks' publication of the full name of all the members of the concern. Some weeks ago Walker & Davis, of Cloverdale, had a car-load of hay burned. They sued the railroad company for the value of the hay, and were nonsuited, on the ground that they had not made the publication of partnership required by law. Whether the law is a just one or not, it is on the statute book, and all firms to protect themselves should follow its direction.

PANAMINT BULLION TRADE.—A dispatch from Baker-field, Kern county, says: A large force of Chinamen are being placed at work opening a new wagon-road from the end of the S.P.R.R. near Allen's camp, to a point east of Tehachipa Pass. This is a preliminary step toward a project which is about being made to bring all the Panamint and Cerro Gordo bullion trade to the S P.R.R. Parties possessed of ample means are connected with this enterprise, which is calculated to enhance the developments of the mining regions of our eastern boundary.

THE San Benito *Advance* is informed that a quicksilver mine has been located about eleven miles south of New Idria. The deposits are reported to be rich in mineral ore, and a company of San Francisco men are interested in prospect, and are about to incorporate.

MINERS are leaving Utah for Panamint.

Good Health.

Imaginative Medicine.

Charms, amulets, talismans and phylacteries all belong to the list of articles which produce imaginative cures; seeing that the persons who trust to them believe in some good obtainable from them, in purse or in person, in health or in welfare; and if the good does come, more assuredly the imagination is the channel through which it approaches. Two or three years ago, at a town in Worcestershire, after the inquest on the body of a man drowned in the Severn, a woman applied to the chief constable for permission to draw the hand of her son, a boy eight or nine years of age, nine times across the dead man's throat, in order to bring about the removal of a wen from the boy's neck. In another instance, in the same county, this was actually done, with fatal results; for the man had died of typhoid fever, which was in this way communicated to several living persons. A ring made of the hinge of a coffin, and a rusty old sword hung by the bedside, are (in some districts) charms against the cramp; headache is removed by the halter that has hung a criminal, and also by a snuff made from moss that has grown on a human skull in a graveyard. A dead man's hand, and especially the hand of a man who had been cut down while hanging, dispels tumors. Warts may be removed by rubbing them with a bit of stolen beef; the chips of a gallows, worn in a little bag round the neck, will cure the ague; a stone with a hole in it, suspended at the bed's head, will prevent nightmare. Many verses are known, which if repeated aloud, are credited with curing cramp, burns, and other bodily troubles. When you have the whooping-cough, apply for a remedy to the first person you meet with riding on a piebald horse—a ceremony that Dr. Lettsom, the physician, was fated more than once to become acquainted with.—*All the Year Round*

How Poor Eyes are Made.—I have, during the past two months, seen lace veils drawn tight over the face in church, both morning and evening. I have seen ladies teaching in Sunday-school and in sewing-schools, where the expression of face has so much to do with claiming and retaining the scholars' attention, with the inevitable veil covering like a mask both faces and expression. Ladies were seen at the evening receptions at the Metropolitan museum of art, looking at pictures and porcelain through lace veils, which in one or two instances were beaded. I myself saw a lady at the Astor library procure the seventh volume of Froude's History of England, which she proceeded to read through a dotted lace veil. And last, but not least, I am told by a friend who attends the art school at the National Academy of Design, that young ladies go there and draw from plaster casts for hours at a time without lifting their black lace veils.—*Cor. New York Evening Post.*

A Word About the Lungs.—In nearly all cases the natural capacity and area of the chest are sufficient for all the uses of respiration. But the capacity of the chest may be diminished by the habit of stooping, or by the abominable practice of tight-lacing. The false grace of the wasp form in woman is almost always gained at the expense of the lungs. The tight belt and the armour above it fatally compress the air-cells, and forbid all easy union of the oxygen of the air with the currents of the blood. The lungs cannot well spare one square inch of the space which they naturally fill. Consumption is the sequel of corsets. The war of hygiene upon tight waists must be positive and unceasing, for fashion is in nothing more destructive to human life than in this. The lungs are also injured by being over-worked, strained, or made to do more than any reasonable estimate of their powers would allow.

Walking as an Exercise.—There is no exercise so fine as walking, if one knows how to take it. When a disease in one part of the body becomes incurable, the physician will sometimes attack some other part with the design of diverting the sickness from its stronghold. So a man who uses his head till his brain is weary needs to tire his legs. One complains that he cannot walk. It is because he does not observe the rules. Walk easily. Take time and do not hurry yourself into exhaustion. By walking a short distance at first, and gradually increasing it, one soon is able to walk eight or ten miles without fatigue, and with good results to health. "At the end of a mile," says an old pedestrian, "walking is delightful. You wouldn't ride if you could." The road to health is too narrow for wheels.

Dyspepsia.—"Dyspepsia is the demon of America," says the Philadelphia *Bulletin*. "Making haste to get rich, America has neglected her stomach; she has forgotten to learn how to enjoy her riches, and her generations of sallow, nervous, unstrung men and women will not be reconstructed in the sturdiness of their forefathers until men and women reach a point where they can take time to dine."

To Stop Nose Bleeding.—Two small arteries branching up from the main arteries on each side of the neck, and passing over the outside of the jawbone, supply the face with blood. If the nose bleeds from the right nostril, for instance, pass the finger along the edge of the right jaw till the beating of the artery is felt. Press hard upon it for five minutes, and the bleeding will cease.

Glycerine.—When it is necessary to give castor oil to children it can be mixed with an equal part of glycerine and two drops of cinnamon to the dose, and will not be recognized.

In typhoid fever and other diseases in which turpentine is indicated, patients often object very much to its taste. The addition of a half an ounce of glycerine to a six-ounce emulsion disguises almost completely the turpentine, especially if a drop of oil of gaultheria or other volatile oil, be added for each dose.

No doubt the principle is capable of wide extension. It is said that cod-liver oil may be disguised with glycerine and whisky. Dr. Snow writes to the *British Medical Journal* that an addition of a small amount of glycerine (about half an ounce to an eight-ounce mixture) will altogether obviate the sensation of astringency produced by the chloride of iron dissolved in syrup.

Consumption.—Dr. McCormack, of London, advances the theory that consumption, or tubercular disease, is caused solely by breathing air that has already been breathed. Vienna is a healthier city than Petersburg, because in the last named city close streets are in universal use, and fresh air is carefully excluded from the room. Eating the flesh of tuberculous creatures will not produce tubercle in healthy animals to whom it is fed. Fats counteract the tendency to consumption. Observation shows that persons who in early life show a taste for fat meat seldom fall a victim to this disease, and, *vice versa*, that consumptives have early shown a repugnance to such food. It is suggested that if the appetite for it is wanting it should, if possible, be created by tonics and abundant exercise in the open air.

Better than Doctors.—An invalid girl in Philadelphia was, it is said, cured of a nervous affection of the spine, which from childhood prevented her from walking, by attending the entertainment of negro minstrels every night for two years. She soon became stronger, and in less than a year could walk home from the theater. She never received any benefit from the best medical advice, and her friends give the minstrels the credit of her recovery.

Useful Information.

Economic Consumption of Smoke.—The operation, at Glasgow, of a patent self-stoking smokeless furnace, is thus spoken of in the Glasgow *Herald:* It meets the case more thoroughly than any invention of a similar kind that has hitherto come under notice, and is as simple in construction as it is efficient in operation. The coal is placed in a hopper, over the front part of the furnace, into which it drops in small quantities through a couple of apertures. It is not necessary to open the front door of the furnace, except to see how the fire is getting on, for by a simple mechanical readjustment, the man in charge of the furnace may regulate the quantity almost to an ounce. As it is added to from above, the coal sinks down and slides slowly until it reaches the bars from the bottom of the furnace. These bars are acted upon by plungers, which carry them forward together, with their layer of coal on top, and then, an eccentric being applied, every third bar in the series is brought back to receive a fresh supply. In this systematic and continuous way the furnace is fed with coal, which passes right through in slow and easy stages, the same quantity of fuel being at all times in exactly the same state. Combustion is, therefore, perfect.

How to Sharpen Steel Drills.—It is not generally known that steel can be made so hard that it will pierce any known substance but a diamond. Many jewelers and lapidaries have great trouble in getting the points of their drills hard enough to pierce an amethyst. For the benefit of miners and others using drills that require a hard point we recommend the following manner of manipulation. The drills should be held, if small, by hot pinchers or tongs, while tempering. First heat the tool to a white heat and then press it into a stick of sealing wax, leave it but a second there, and then stick it into the wax in another place. This operation is rapidly repeated until the graver is too cool to enter the wax. In turning or drilling the tool is moistened with oil of turpentine.

A Long Continued Fire.—The longest blast of a charcoal furnace yet announced is that of the Shelby Iron company's furnace, at Shelby, Alabama. It has now been working continuously for three years and seven months, and has made an average of 100 tons per week since it blew in. The greater part of the production has been an excellent iron for car wheel purposes, and its quality ranks it among our very best American irons. The ores used are limonites, yielding, when roasted, about 53 to 54 per cent. in the furnace. The consumption of charcoal has been 130 bushels (of 18½ lb.) per ton of pig iron produce. The lining of the furnace is of fire brick, made at the works from clay found in the neighborhood.

What Coal Loses by Being Made Into Coke.—From an exchange we learn that Connelsville coal, which may be taken as the standard of coking coals, weighs 80 pounds to the bushel. When properly coked, 100 bushels of coal yield 125 bushels of coke, weighing 40 pounds to the bushel; that is, 8,000 pounds of coal produce 5,000 pounds of coke, or, in other words, the coal gains 25 per cent. in bulk and loses 35⅓ per cent. in weight.

How a Feather Grows.—In the skin of a bird where a new feather is to grow, there is a little pit, and at the bottom of this an elevation or pyramid; extending up one side of this pyramid is a groove or furrow, deepest at the base, and gradually growing shallower until it disappears, near the top; from this furrow a great many smaller grooves extend around to the other side of the pyramid, and these also decrease in depth and at last disappear just as they are about to meet on the side opposite the large furrow. The whole pyramid is covered with skin, and the surface is made on the same scales, or flattened cells that are made over the rest of the surface of the body, but, instead of falling off when they are pushed out by the new ones below them, they become united or welded to each other, so as to form a horn coat over the surface of the pyramid, with ridges on its lower or inner surface corresponding to the grooves on the pyramid; and as new cells grow at the base, this coat or cast of the surface is pushed upward till it breaks at its thinnest part which, is of course, the smooth part without ridges opposite the large furrow; and then as it is pushed onward and flattened, it assumes the form of a feather, the ridge formed in the main furrow being the shaft, while the casts of the side grooves form the separate barbs of the vane. When all of the vane has been formed and pushed forward, the pyramid looses its grooves and becomes smooth, and the wall now formed on its surface, being of the same thickness in all parts, does not break, but remains tubular, and forms the quill, which is attached to what is left of the pyramid. A finger-nail or a hair is formed from the same kind of scales in the same way, the process differing only in those features which give to each organ its special character. Feathers, scales, hair, claws, all are made alike from the dead, flattened cells crowded to the surface by the process of growth.

Durable Soap Bubbles.—To obtain soap bubbles that will show the changing colors of the rainbow the directions are as follows: Take half a pint of water that has been boiled and become cold, and put into it a quarter of an ounce of Castile soap, cut up fine. Put this in a pint bottle, and set it in hot water in a saucepan, on the fire; there let it remain an hour or so, now and then give it a good shaking till the soap is disolved. Let the fluid stand quiet for the impurities and coloring matter of the soap to settle; then pour off the fluid and add to it three or four ounces of glycerine, and your soap-bubble solution is ready. In an ordinary way you may blow the bubbles easy with a tobbaco pipe, but if you wish to attain scientific perfection, you had better employ a glass pipe. By adding a larger quantity of glycerine you may make these bubbles so strong that you can play battledore with them.

Making Animal Hair.—A method of treating animal hair for the use of the hatter, which has been kept secret for a long time, is now found to consist in the application of a solution of the nitrate of mercury, for the purpose of preventing the putrefaction of the fibre. This substance, however, is very deleterious, it is said, both to the health of the workmen and to the implements of the trade, and recently carbolic acid or creosote has been used to great advantage as a substitute. This has the property not only of preserving the animal matter, but of causing the hairs to contract, thus rendering them more apt to felt. The subsequent treatment of the fibre is according to the process usually pursued in this industry, and the carbolic acid may be added to the oleaginous or astringent elements used by hat manufacturers.

Casting Ingots.—Mr. Leffler, of Sheffield, iron merchant, has patented some improvements in moulding for casting ingots. The novelty of these improvements consists in forming a central mold, and in surrounding it with moulds in such a manner that each side of the central mould shall form a side or end of one or more of the surrounding moulds by means of hollow iron pieces or iron plate linings, fitted closely into holes or apertures made in the lower parts of the sides of the central mould and covering the surrounding moulds with a stopper, having a hole for the escape of air and gasses, and in forming the moulds by preference open at the bottom, and piecing them, during the process of casting, upon a bottom plate.

Hardening Steel.—Instead of hardening steel by plunging it into cold water and afterward lowering the temper, which is thus made too high, Captain Carson recommends the use of water which is warm enough to produce just the desired hardness. The temperature of the water will depend not only on the temper desired but also on the size of the article, and is easily ascertained by trial. For the springs in the needle gun he used water about 130 degrees F.; for some kinds of steel boiling water is preferable. The effect of cooling in hot water on soft steel containing 0.2 0.4 per cent. carbon is to increase its tenacity and elasticity without much change of hardness.

Your Own Mason.—Small holes in white walls can be easily repaired without sending for the mason. Equal parts of plaster of Paris and white sand—such as is used in most families for scouring purposes—mixed with water to a paste applied immediately, and smoothed with a knife or a flat piece of wood, will make the broken place as good as new. The mixture hardens very quickly, so it is best to prepare but a small quantity at a time.

It is said that a rifle bullet cannot penetrate thirty sheets of paper,

Domestic Economy.

The Christmas Pudding.

BY "JEANNETTE AND JEANNOT."

If you wish to make a pudding in which every one delights,
Of a dozen new-laid eggs you must take the yolks and whites;
Beat them well up in a basin till they thoroughly combine,
And shred and chop some suet particularly fine.

Take a pound of well stoned raisins and a pound of currants dried,
A pound of powdered sugar and a pound of peel beside;
Stir them all well up together with a pound of wheaten flour,
And let them stand and settle for a quarter of an hour.

Then tie the pudding in a cloth, and put it in the pot,
Some people like the water cold, and some prefer it hot;
But though I don't know which of these two methods I should praise,
I know it ought to boil an hour for every pound it weighs.

Oh! if I were Queen of France, or, better still, Pope of Rome,
I'd have a Christmas pudding every day I dined at home;
And as for other puddings, whatever they might be,
Why, those who like the nasty things should eat them all for me.

Unfermented Wine.—This article is coming quite extensively into use for church purposes and when mixed with water it also forms a very refreshing summer drink. In order to prepare it the grapes should be allowed to thoroughly ripen. They are then picked and the stems and all green and rotten grapes removed. The grapes are then crushed and pressed in the usual manner. The juice may be put directly into bottles, or it may be first concentrated somewhat by boiling, and then bottled; in either case the bottles are put into hot water and brought to the boiling point, where they are maintained for half an hour. At the end of this time remove them from the fire and cork them tightly, while still hot, wiring in the corks. Then replace them and continue the boiling another hour. Glass bottles are better for this purpose than tin cans, though the latter may be used. An analysis of a specimen prepared in New Jersey gave the following result: alcohol, none; sugar and extract, 23.00; ash, .40; water, 76.60; total 100.00. This had probably been concentrated somewhat before bottling. The flavor was fine. Some acid tartrate of potassium had crystallized out.

Home Made Candy.—Use a new tin basin; put into it four tablespoons of water, one pound of coffee sugar, one teaspoonful of good cream tartar; boil, stirring constantly to avoid burning. After it begins to have a sappy appearance try it often by dropping a little in cold water and if done it will at once become brittle. Butter an earthen dish and pour the hot candy into it, that it may cool just enough to handle. Flavor to taste with oil of peppermint, wintergreen, sassafras or lemon. Two drops of oil will flavor it strong. For variety, divide into three or four parts and flavor differently by touching one kind of oil to each. Work in the hands at once; the more it is pulled the whiter it will get.

How I Made My Catsup.—I selected fair ripe tomatoes, cut out all blemishes, also the hard parts about the stem end, then slice them into a porcelain kettle, filling it full; added a red pepper and put the kettle over a slow fire to stew gradually stirring to prevent burning. When reduced to half the original quantity I strain the whole through a common wire sieve. To five pounds of the pulp I added one and one-half pounds of sugar, one pint of cider vinegar, one tablespoonful of cloves, one of allspice, two of cinnamon, one of salt. I put the mixture back over the fire and boiled until the thickness suited. When mine was tested the only fault found was that it was too good to last.

Scotch Broth.—Put a teacupful of pearl barley into 4 quarts of cold water and let it boil; add 2 pounds of scrag of mutton or thin flank of beef, 2 onions, 2 turnips, 2 carrots cut in dice, and 1 carrot grated; boil slowly for three hours; add salt and pepper to taste before removing from the fire.

To Sweeten Salt Pork.—Cut as many slices as will be required for breakfast the evening previous, and soak till morning in sweet milk and water; then rinse till the water is clear, and fry. The pork will be found very near as good as fresh.

German Toast.—To one egg, beaten well, add one cup sweet milk or cream, season with a little salt and pepper. Cut in slices stale bread, and dip in the milk to moisten, and fry in butter on griddle. This we think is an extra nice dish for breakfast.

Nice French Cake.—Two cups of sugar, one half cup of butter, four eggs, one cup of milk, three cups of flour, one teaspoonful of soda, and two teaspoonsful of cream of tartar. This makes two loaves.

To Disguise Castor Oil.—Rub up two drops of oil of cinnamon with an ounce of glycerine and add an ounce of castor oil. Children will take it as a luxury, and ask for more.

THE Commissioner of the Land Office has rejected the adverse claims of the Utah lode and City Rock lode versus the King of the West mine, Utah Territory, because the Utah adverse olaim was not sworn to by the adverse olaimant himself, and the City Rock adveree olaimant did not properly allege ownership and the premises described in the adverse claim did not conform to the location notice.

PANAMINT has etarted in with its first mining suit, in which property to the value of $100,000 is involved, The suit is brought by D. S. Tipton against J. Scobie, John P. Jones, and the Snrpriee Vallev Mill and Water company. The suit; as affeoting Joues and the milling company is simply to recover of them $10,000, the value of one-sixth of the Wyoming as sold to them by Scobie.

THE daily yield of ore from the principal Comstock mines, last week, was as to-lows: Crown Point, 500 tons; Belcher, 450 tous; Coneolidated Virginia, 400 tons; Ophir, 250 tous; Dayton, 65 tone; Chollar, 50 tons; making a total of 1715 tons. The Sierra Nevada and Woodville are aleo taking out considerable quantities of ore.

A CAR loed of ore bronght to the Humboldt reduction works last week, from the Defiance mine, Lewis district, yielded as follows: No. 1, first-clase assorted ore, $509.65 per ton; No. 2, average assorted ore, $136.86 per ton. The ore was taken from droppings on the surface, and it is said that there is plenty of it.

College of Mines, University of California.

The College of Mines in the University of California, is being rapidly organized, so that full opportunities may be afforded for the training up of mining engineers and metallurgists on this coast. This department of the University is not yet in full running order, although courses of lectures on subjects connected with mining are now being delivered. It is not proposed to orgenize a special class in the College of Mines until next year. Those who are now sophomores or freshmen may expect to have the college open to them after they have completed the preliminary two yeare of instruction which are required of all scientific etudents. The faculty of the College of Mines ie as follows: D. C. Gilman, President; William Ashbnrner, professor of mining; John Le Conte, professor of physios and mechanics; Joseph Le Conte, professor of geology; Wm. T. Welcker, professor of mathematics; Frank Soule, professor of engraving; Willard P. Rising, professor of chemistry and metallurgy; Geo. F. Becker, lecturer on metallurgy for the current year. Mr. Ashburner, the well-known mining engineer, has charge of thie department, and is now engaged in deviesing methods of work and plans of instruction. Preliminary steps have been taken by the regents of the University for the appointment of a special profeesor of mechanics, and also to secure the services of a mineralogist. As soon ae the mineralogist is appointed steps will be taken to errange and olassify

The Collections of the University.

These collectione include: 1, all the materials of the geological survey of Californiа, brought together by Prof. J. D. Whitney, State geologist; 2, the valuable mineralogioel collection of Mr. H. G. Hanks, given to the university by James R. Keene, Esq.; 3, the collection of ores, rocks, fossils, etc., collected by Mr. C. D. Voy, and presented by Mr. D. O. Mills; 4, the cabinet of the late Mr. F. L. A. Pioche; and, 5, numerous gifts of individals. The university also owne a large collection of the Ward geological casts. At present these valuable collections are of but little use, as they are not all classified and arranged. The Hanks collectiou is all arranged, and the specimens identified and labeled; but that of the geological survey is in a state of confnsion. It will take npwards of a year to arrange these collections ae they ehould he.

In addition to the above named ecientific professors the literary professore of the university give instruction in their various departments, so that the students of this course have the opportunity of acquiring French, Germau and Spanish, and also Italian if they desire to do so. The study of the English language, literature and history, is also pursued with thoroughness.

The Course of Instruction

Occupies four yeare, leading to the degree of Bachelor of Philosophy in the College or Couree of Mines. Studente who desire to receive the degree of Mining Engineer muet continue their studies for two years more, and must exhibit to the Faculty satisfactory evidence of their power to apply in actual work the knowledge they have acquired.

During the first two years of undergraduate work, the studies of the course are the same as those of the other ecientific colleges in the University of California. During the last two years the atteation is directed chiefly to chemistry, metallurgy, geology, mineralogy and engineering, though the study of modern languages is also kept up. The scientific studies are taught, as far as possible, with reference to tbeir applications in mining, and the entire work of the last two years is superintended by the Profeseor of Mining, under whoso special guidance the mining stndents learn. Opportunitiee will be afforded to that class to visit some of the industrial establishments of San Francisco, and they will be encouraged to extend their visits to mining and metallurgical worke at a distance. A prize of fifty dollars is offered for proficiency in this department of study.

The Laboratories

For chemistry and metallurgy are new, extensive and well furnished. They afford excellent opportunities for becoming proficient in assaying and analytical chemistry. The engineering instruments and the physical apparatus are also of the best kind.

Terms of Admission.

The next year of instruction begins August 12, 1875. Examinations for admission, June 7th. and again August 11th, at either of which times the candidates may apply. On application a circular will be eent to those desiring information or those who propose to enter the University. Tuition is free to students from any place within or without the State.

A numb r of lectures have been delivered withiu the past two months on subjects connected with mining, one of which, by the Professor of Miuing, will be found in another column. We shall endeavor to obtain as many of these lectures as possible for the benefit of those unable to hear them. We are glad to note that a good start has been made in the direction of mining educat on on this coast where the facilities are so great for practical illustration and instruction.

Piling Wood on a Side Hill.

We have received the following letter from a correspondent in Auburn: "Will you please answer this question:—a man buys a quantity of wood, and the seller hauls end pilee it on a smooth, steep side hill. The wood is piled between two stakee, just eight feet apart, and four feet high. The stakes stand perpendicular, but one is raised high above the other, as the hill side raiees, the pile of wood lying up and down the hill. The hill rises at an angle of 45 degrees. The wood wae piled up to the full hight of the stakes in a satisfactory manner. Now, tho wood man claime that there is a cord of wood in the pile while the other party saye there is not a cord. Admitting thet the

Fig. IV.

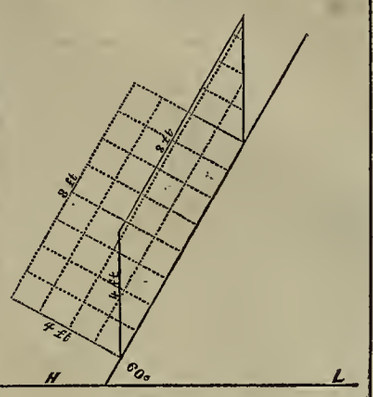

Fig. III.

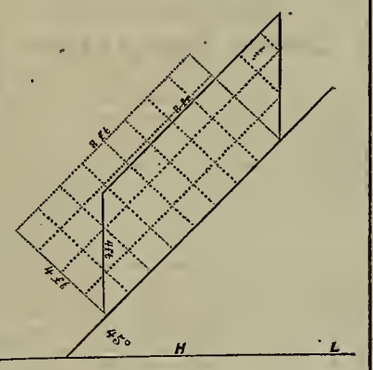

Fig. II.

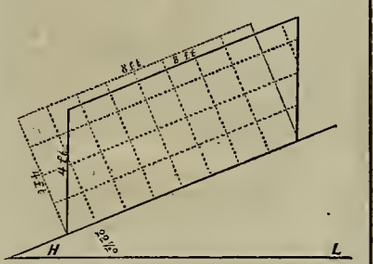

Fig. I.

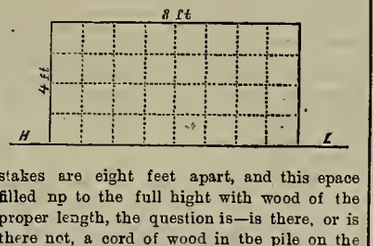


stakes are eight feet apart, and this epace filled np to the full hight with wood of the proper length, the question is—is there, or is there not, a cord of wood in the pile on the side hill. The subject has become one for general discussion here, and many of us are interested to know who is right."

A cord of wood measures eight feet in length, four feet in hight, and four feet in width Piled on level ground, it contains 128 cubic fee of wood. But when piled on a hill at an angle of 45 degrees with the eame measurements, in the way it ie usually piled, there would be only 90.56 cubic feet in the pile. Therefore when piled on a hill rising at an angle of 45 degrees, the buyer would lose 37.44 cubic feet of wood.

This does not seem apparent at first glance, we have heard some warm arguments over the question, but a little investigation showe it to be true. We have prepared a few diagrams to illustrate the decrease in cubical contents in a simple way. Figure 1 ehowe a cord of wood eight feet long, four feet high and four feet wide. Figure 2 shows how it would appear at an angle of 22½, representing the true cord by dotted lines and what is nsually considered a cord by wood-choppere, by the etraight black lines. *H L*, is a horizontal line. Figure 3 shows it piled at an angle of 45 degrees, end the loss of wood mey be easily seen to be more than a quarter. Figure 4 shows it piled at 60 degreee, in which instance, although the outside measurements are the same, more than a half cord is lost. The usuel method of measnring the wood is the seme in each case. The stakes are perpendiculer end the pile measures four feet in hight by the stakee and eight feet in length. Nevertheless, ae the angle increases the cubical contents decreaee in proportion. While the stekee would not decrease in length and the measurements would remain the same, by increasing the angle, there would not be any wood at all.

Any one can illustrate this for himself by taking a small piece of board and inserting two pieces of wire, each say four inchee long and two inchee high. These can be pleced upright in the board as if enclosing a pile of wood of certain dimensions. Now cut a number of small pieces of wood of equal length and fit them in between the wires. After that remove the pieces of wood, set the board at an angle of 45 degrees, end bend the wires so as to stand perfectly upright. Then pile the pieces in again end you will find that you have more wood than you can get in between the wiree. This will illustrate the question practically to those who fail to see it themselves.

Although people do not alwaye buy wood piled on hills of 45 degrees, they ofteu buy it on hills nearly es steep, and perhape few have thought it made any difference ee long as the pile measured the same at both ends and wae of proper length and width. Our diagrams will ehow that they do not get as much wood ae ie coming to them. Our wood-choppers may not relish the idea of always having to cord the wood on level ground, but if purchasere desire full measure they ought to insiet upon it. The "practical man" who is skeptical and doee not believe "but that there is ae much in each pilee, had better pile a cord upon a level and then pile it between bis stakes as usually set on a side hill, and he will find that his wood goee up over the top of the stakes.

Hydraulicing for Quicksilver.

Some of the quicksilver mines recently opened in this State are commencing to work ore of a very low grade, and are making a good profit from it. The high price of quickeilver enablos them to handle poor ores which were formerly useless. In some of our mines, however, the quicksilver is found in a native state in small quantities and may be gathered without paesing through any roasting process. At the Rattlesnake miue for instance, considerable quicksilver was taken out by meane of ordinary rockers. At the Yellow Jacket mine a new syetem ie to be adopted for getting out the metal. The *Russian River Flag* states that a reservoir 310 feet above the mine hae been built, 1,000 feet of hose and 2,000 feet of sluice boxes have been obtained, and the new work of chiseling down the hill will open next week. They expect to handle 3,500 tone of earth and rock, and do the work of 200 Chinamen a day. It is believed that ore that will yield one-tenth of one per cent will pay for reduction, as the water can be made to reduce the bulk of earth and rock eo that the result will be two or three per cent ore.

This seems to be a common-sense way of handling large quantities of poor dirt, ae it ie simply a procese of concentration on an economical system. With an abundance of water under a good pressure they might do coneiderable execution. Of couree all cinnabar deposits could not be worked in this manner, and it ie only where native quicksilver is scattered through dirt and debris that it could be made to pay at all.

AN immense vein of copper, said to be traceable for the distance of a mile has been discovered in the Babbit Hole range in Humboldt county. The locality was formerly an Indian stronghold, and one Pat Belle wae guided thereto by an Indian deputized for the purpose by the Princess Sarah Winnemucca. The *Silver State* says the ore carries a large per centage of copper and probably silver.

THE old Imperial mill in Gold Hill, which was built in 1860, and the second on the lode that crushed ore, after having its machinery taken out and standing dismantled and deserted for some time, yielded, a few evenings since to the ravages of time and a whopping Washoe zephyr and tumbled to the ground.

A NUMBER of men are enxiously waiting for the expiration of the time allowed hy law, that they may locate ledges on which a failure to do the necessary work will be the signal of abandonment of the same.

SIXTEEN and a half million ponnde of crude bullion hae been shipped from Eureka in the last twelve months. Some of it has been sent to San Francisco, some to Omaha, and some further east.

PIOCHE miners are anxiously awaiting for the result of explorations below the water level in the Raymond & Ely mine. That exploration cannot be made until the machinery for pumping the water is in motion.

Jones' Heel Trimming Machine.

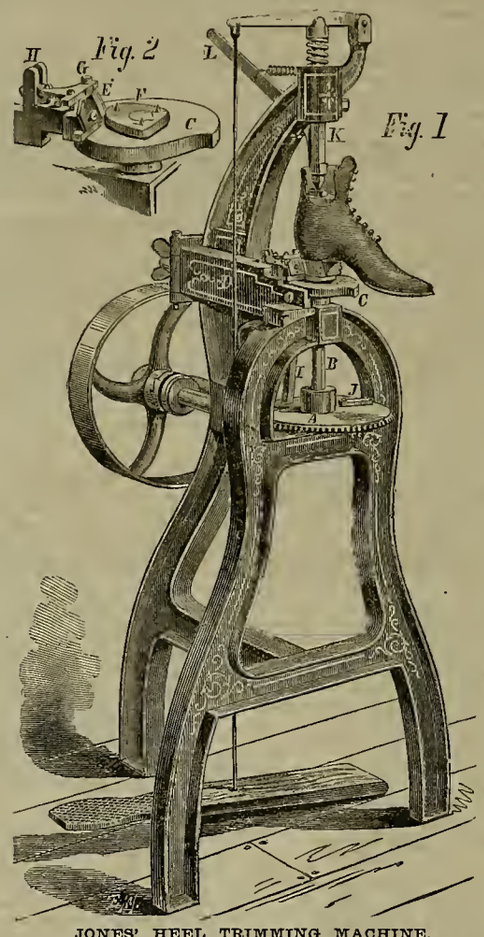
In the invention represented in our illustration are combined a variety of novel devices which, together, form an improved machine for trimming shoe heels. The motive power may be steam, in connection with a pulley, or hand labor, employed through a crank. Upon a horizontal shaft is a bevel gear wheel, *A*, which rotates the vertical shaft, *B*. At the upper end of the latter is a double cam plate, *C*, the edge of which is suitably shaped to allow the arm which carries the knife to move onward at the proper time. The *D* or arm is hinged to a plate attached to the rear part of the frame. Upon its inner side is formed a socket to receive the knife bar, into which is adjusted a screw rod (operated by a thumb nut, shown at the rear) which limits the movement of the knife, and also serves as a guide for a coiled spring, by which the latter is held out to its work.

In Fig. 2 the cam plate and cutting mechanism are represented on a larger scale. *E* is the knife, in front of the right hand lower corner of which projects a finger, which rests against the guide, *F*. The latter is secured detachably to the shaft, *B*, above the cam plate, as shown. It is of the exact form of the required heel, and must be changed for differing sizes of the same. On the upper side of the knife bar, at *G*, is a gage, which presses against the contour, and, projecting a little in front of the edge of the knife, keeps the same evenly around the seat of the heel. It may be raised or lowered to suit various hights of heels, and may be moved nearer to or further from the work by means of the screw operating in the slotted projection, H. There is also a washer under the guide, *F*, which raises the same so that the knife may rest against it for a distance of an eighth of an inch or more, as desired.

To the forward end of the arm is attached a hook rod, which enters a groove under the cam plate. This portion of the device is necessarily hidden by other parts in the engraving. The object, however, is to cause the knife to move forward quickly to cut the elongated sides of the heel, and slowly while cutting the short curve of the real portion of the same. At *I* is shown the lower extremity of a drop or clutch, which is hinged to the frame at or near its middle, so that its upper end enters a socket in the under side of the arm. At a certain point of the revolution of the gear wheel, *A*, a stud, *J*, thereon comes in contact with the drop and carries the same partially around, thereby relieving the strain on the hook pin when it enters the short curve of the slot of the cam plate, at the same time serving as a brake.

The rear leg of the frame projects upward and curves forward, so that its upper extremity is directly over the vertical shaft, *B*. Through this upper end passes a shaft, *K*, which connects with a spring lever above. The latter is operated by the treadle shown, and the device serves to hold the shoe down upon the guide. Near the lower end of the shaft, *K*, is a joint worked by the lever, *L*, the object of which is to trip the shoe when it becomes necessary to give one part of the heel more bevel than another. The knife bar has a spring upon its under side which will allow of its conforming to all ordinary styles of heels without requiring the employment of the tripping lever.

The mode of adjusting the shoe to be operated upon is already shown in Fig. 1. The pulley is operated over about 2½ revolutions to trim the shoe, and the speed required is some fifty revolutions per minute. For further particulars relative to sale of rights, etc., address the inventor, E. U. Jones, Woodhaven, Queens county, N. Y.



JONES' HEEL TRIMMING MACHINE.

The Franklin Institute of Philadelphia, encouraged by the success of its late Industrial Exposition, at which it cleared $56,000, proposes to purchase the lot on which its exhibition was held, being the square bounded by Thirteenth, Market and Juniper streets, and erect on it a building for the purpose of a permanent display, which will not only be a show, but a technical and art school, something after the Kensington Museum, in London. The estimated cost is $2,000,000.

The Silver *State* says that the mines in all sections of the county are turning out well, and great numbers are paying. We seem to be entering upon a new era in this branch of industry. Nearly every mining district is shipping more or less bullion.

A company has been formed at Salem, Oregon, to build a canal around the Cascades on the Columbia river. Surveys have been made, and the estimated cost is $250,000 It will probably cost considerably more than that.

The Victoria claim, at Cariboo, B. C., is taking out a thousand ounces weekly. The Vulcan comes second. All the claims on Lightning creek are doing better than ever.

Accident at the Mint.—Martin Bulger, chief engineer at the new mint, has received serious injuries by the falling of a heavy piece of metal on his foot.

The New Belcher Air Shaft.—The new air shaft is down nearly 110 feet, and the upraise started from the 850-foot level, to connect with it, is progressing upward at a lively rate.

Venus and her Secret.

The observations of the transit of Venus appear to have been very successful at most of the stations which were in telegraph communication with the rest of the world. Reports to this effect have already been received from many widely separated points. So closely was the little planet watched in her shadowy journey across the sun, and so many eyes were kept upon her every movement, that the great secret—that wonderful secret which she has kept ever since the morning stars together sang their first chorus, will no doubt be fairly and fully drawn out from her blushing, radiant face.

It is now fully 150 years since it became well known that Venus possessed this secret, but how to wrest it from her has been the riddle. The opportunities of finding her in the mood have been rare, and hitherto the ingenuity of men has not been sufficient to devise the ways and means. But study and skill it is supposed have at length put such appliances into the hands of our scientific detectives, that when the case is fully worked up, the secret will be fairly won.

Those whose early hours of rising have given them the opportunity of late, to study her merry twinkles as she peeps up over the hills in the early morning twilight assure us that she gives every indication of a knowledge that her secret is out, and that the astronomer may hereafter make his calculations with such unerring certainty that the paths and distances and motions of the celestial bodies may hereafter be determined with such a degree of accuracy that the sailor as he pursues his trackless way across the ocean may henceforth have no forebodings lest an error in his chart or lunar may precipitate his ship upon some dangerous or inhospitable rock, which science had erroneously told him was far to the leeward or the windward of the point where that same science had told him he then was.

This great and important secret, which has been so long and so well kept, is nothing less than the parallactic angle of the sun. Upon the accuracy with which this angle is measured, depends the calculation of all astronomical distances—that of the sun itself from the earth and the distances, not only of the planets but of the fixed stars also. Indeed it is impossible to fully appreciate the real value of this secret when once in possession of the scientific world. All honor to the governments of the earth which have fitted out so many expeditions as to leave no possibility of failure either from unfavorable weather or the dangers of the sea. The thanks of the world, and particularly of the sailor, is also due and should be freely rendered to the skilled artizans whose delicate and scientific manipulations have wrought out instruments so infinitely superior to any which have heretofore been constructed, and which superiority, alone, is the means by which the great expected end is to be produced.

The Rewards of Perseverance.

In the mining regions of California may be found perhaps the best illustrations of what perseverance and energy will do, that it is possible to get. Hundreds of cases might be cited where poor but energetic and hopeful miners have worked for years to strike a lead, knowing when they started work about how long it would take them to accomplish their object. In the face of all obstacles, however, they persevere, and are generally rewarded in the end. In the gravel mining regions of the State, where the miners often have to run long tunnels under the mountains to tap the auriferous gravel, these instances are quite common. Here four men own an interest in the prospect, and while one or two work on the claim, the others work for wages, and keep the pot boiling for the crowd.

It requires considerable pluck to start a hole in a hill when you know that work as hard as you may it will be four, five or six years before you can get any return for your labor. Most men would falter at the prospect, even if they were guaranteed a certain sum at the end of that time. In these cases, however, there is no such real certainty, for the gravel when struck may be poorer than was expected. Still, in most cases, when they do strike the old channels, they get pretty well paid for their labor. There are at the present time hundreds of miners engaged in just such undertakings as we refer to, and every few months we hear of some one who "has tapped the lead," and made a "home stake."

The latest instance of this is in the Empire gravel mine, at Table mountain, opposite the Illinois ranch, Tuolumne county. The tunnel was completed a few weeks since, and the Tuolumne *Independent* says they have struck the channel with a good bed of gravel which prospects very fair. They have already passed through 25 feet of gravel in this front channel, and intend to run across, and thence over the high ledge to the back channel, where the boys say there is gold enough "to enrich every male and female citizen in Tuolumne county." This back channel, they affirm, is the old Caldwell or Whimtown gravel lead. Over seven years ago this ground was taken up by Felix Ohar and Mons. Bonnefoi, of Sonora, the former having worked alone, and scarcely without intermission ever since. They ran a tunnel over 800 feet, the whole distance through basaltic rock heavily impregnated with cube sulphurets. To string out the length of fuse and candles burned during the construction of this tunnel would reach many miles. We doubt if there are many men who would, with such tenacious perseverance, have completed this enterprise under such adverse circumstances.

The School Ship.

Now that a school training ship for this port has become a thing of certainty in the early future, it is desirable that no mistake should be made in the inception of the enterprise or in the mode of its management. We presume that it is understood that the main object shall be to give to street boys, otherwise unprovided for, an education that will fit them for the sea, and make of them respectable and useful members of society. In selecting candidates for the school we further presume that such persons will be selected as may be considered more or less in need of reformatory training. It is intended not only to educate them as sailors, but to correct any evil habits they may have contracted or tendency to crime they may have exhibited. Of course confirmed criminals or notoriously bad persons should not be received. This, we believe is substantially the course pursued in selecting candidates for school ships at the ports of New York and Boston. The school ship enterprise, we believe, has proven decidedly successful in both the cities named.

At New York over 2,000 boys have entered the ship, the greater portion of whom were entirely destitute of homes or friends, and more or less incorrigible—so much so that without such intervention, the most of them would, in all probability, have eventually found their way to the house of correction or the states prison. A large portion of them have passed from the school ship into honorable positions in life. Some 500 of the 2,000 have shipped as a superior class of sailors, and have done credit to themselves and their training. Many have been fully reclaimed and taken back by their parents to enter upon other avocations than those connected with the sea. The New York *Herald*, from which we glean these facts, says that 90 per cent. of all those discharged have turned from their evil habits and become steady, useful men. The schoolship has saved the boys from vagabondism, and society from the cost of the crimes and punishment inseperable from such life.

It is to be hoped that a similar course may be pursued in the case of the San Francisco school ship, and that the work may be attended with equally good results. We have a class of boys here, naturally good enough, and as smart and capable as any set of boys in Christendom. They are going to the bad more from the force of circumstances than from any innate desire to lead a life of vagabondism. Let a helping hand be extended towards them; let there be some honorable occupation devised upon which these boys can enter, and the question of "What shall we do with our boys?" will be fully settled, at least for the great majority of them. We trust that the schoolship will be held for the benefit of just that class of boys which we have pointed out.

Commender Glass has prepared a plan by which the training ship may be regulated and maintained, which appears to be wise and judicious, and we see no reason why it would not be applicable to the particular class of boys to which we have alluded. The ship must be principally maintained at the expense of the city; and if so the city should have the benefit of it—not a few parents and boys merely who are abundantly able to take care of themselves and what belongs to them.

Big Work.—The Virginia *Independent*, of Dec. 11th, in speaking of work at the Sutro tunnel, says: During the week ending Dec. 8th, the heading has been advanced 90 feet, and is at the distance of 7,752 feet from the mouth. During the first four days of the week four drills were used, but during the last three days only two were in operation. Only 45 men are employed, and of them three are foremen. The work is not only the greatest yet done on the tunnel, but is the greatest yet done in the world's history of tunnel making, when the force is considered. It lacks only one foot in the entire week's work of averaging 13 feet per day. There are 11 inches of water running in the tunnel.

The Los Angeles *Express* has been shown a specimen of cinnabar, taken from the croppings of a lead about fifty miles north of that place. It is believed that this is a continuation of the veins discovered near Cambria, San Luis Obispo county, and which have been traced down the coast to the Santa Ynez discoveries, in Santa Barbara county.

Beach Mining.—The Crescent City *Courier* is informed that the recent storm was the occasion of the reaping of a golden harvest by the two mining companies on the beach at Gold Bluff. The Lower Bluff company took out of one retort last week 132 ounces of dust. Another day of the same week they made a clean-up of 28 pounds of amalgam.

Pine Mountain Cinnabar District is situated in San Luis Obispo county. It is from 12 to 15 miles north of Cambria, and extends from the San Simeon creek six or seven miles in a northerly course along the summit of Pine mountain.

The weather has been very mild so far this winter in Utah, and miners generally are actively engaged in the mountains.

The Profession of Mining Engineering.

We make the following extracts from a lecture "On the Profession of Mining Engineering," recently delivered by Wm. Ashburner, Professor of Mining in the University of California:

Mining engineering, in its most general sense, is the application of science to the discovery and working of mines, and to the subsequent treatment of ores. Civil and mechanical engineering would teach us in this connection, surveying, the use of instruments, the resistance of materials, and the construction and erection of all mining machinery.

The more special branches of study which are followed in forming the mining engineer are those which relate directly to the mineral kingdom. Through geology we learn of the structure of the globe, of its mineral constituents, and the causes of its physical features.

Mineralogy teaches us more in detail the properties of all mineral substances, and to distinguish, characterize, and classify them. Inorganic chemistry teaches us the nature and composition of all mineral bodies, whether simple or complex; how to combine and how to separate them.

Metallurgy is an art eminently industrial in its nature, and requiring for its successful accomplishment, whenever a new path is to be followed, a man well versed in principles, with a practical turn of mind. "It is the art," says Professor Lesoinne, of the Liége School of Mines, "of making money by treating all ores." The effect of the pun is lost in translating, but under this play upon words the professor expressed a profound truth. Although metallurgy is based upon chemistry, and the metallurgist must be a good chemist, yon can rarely succeed in forming the first out of the latter. The conditions under which the two pursuits are followed are essentially different. It matters little to the chemist in what portion of the globe he is pursuing his experiments, or what may be his physical surroundings, he has always the same elements to manipulate, and his reactions are always the same. With the chemist the final result is all important and it matters not to him how much it costs, he deals in small quantities, and the success of an experiment in adding to his knowledge is incomparably greater than the mere money expenditure required to bring it about. With metallurgy, on the contrary, money is the final result, and no process of treating ores, however beautiful in theory, or ingenious in execution, can ever be other than failure if it costs more than it comes to. This is the fundamental principle of the art, and before attempting to decide whether a process is likely to prove successful, or even possible, it is always necessary that the local conditions should be carefully studied and thoroughly investigated.

The Field for the Application of Science in Metallurgy.

In no branch of the profession is there so much room for improvement, and so wide a field for the successful application of science as in metallurgy. During the past 40 years, or since technical schools have been established in all industrial countries, the progress has already been enormous, and mines are now worked, and ores of so low a grade successfully treated, as would have been impossible a few years ago. Much yet remains to be done, and he who through inspiration has the talent to conceive, and through experience the skill to carry into effect, a process by which the cost of any article of universal demand may be reduced, will be sure of a large earthly reward.

There is probably no subject, when its high importance is duly considered, on which there are entertained so many erroneous notions as on that of mines. Nor is it extraordinary that this should be the case, for many persons otherwise well educated have never had their attention directed, either specially or generally, to this matter. It is rare that we find a cultivated person who does not possess some knowledge of agriculture, of buildings and of manufactures, for, from his earliest childhood, he has seen fields in process of cultivation, and crops growing, houses being erected, and manufacturing establishments in full activity. But his life may and very likely has been passed at a distance from a mining center, where, had he so desired, it would not have been possible to have visited underground works, and nothing but a stronger sentiment than that of mere curiosity or even the desire to gain general information would prompt a person to visit mine after mine and undergo the labor, danger and fatigue necessary to acquire even a superficial knowledge of this subject. Consequently we see the most extraordinary misconception of the nature and value of mines, particularly those of the precious metals, entertained by men who, from their official or social position, ought to be better informed. We have within the last few years seen a Commissioner of the General Land Office expressing himself in his annual report as being anxious to make a conservative estimate of the gold fields of California, yet assuming that one hundredth of the Sierra Nevadas was composed of auriferous quartz, capable of paying large profits, and which only needed to be worked to do so. Still later we have seen the strange spectacle of a bishop so overcome, by what he saw during a visit to the mines of Montana and Nevada, that through the columns of the press he recommended that they should be devoted to the payment of the national debt; and the description he gave of all this wealth appealed so strongly to the imagination that in comparison the Arabian tales seem tame.

Principles in a Professional Career.

From this almost universal ignorance on the part of the public arise numerous blunders and mistakes which are only too frequently disastrous in their consequences. The average American prides himself upon being eminently practical, and seeks to cultivate a habit of thought which induces him to pay very little attention to principles and a great deal of attention to results—a state of mind which finds him an easy prey to the designing and a ready dupe of the charlatan. It is, however, with principles that you will be brought into close contact in any professional career you may choose to adopt. In mining and the branches of study that are immediately connected with it, it is particularly important that you should, from the very outset, form correct notions and be guided, whenever possible, by sound principles. Unfortunately, science and study have done little that lead us toward positive conclusions with regard to the discovery of new and valuable mines and deposits of ore, and these, when found, appear to be more the result of accident than scientific research. In fact, it is pretty well recognized that all surface indications are of but doubtful value and that the only thing that can assure one of the value or even of the existence of a mine is its actual discovery and successful working. It is not so however, with the negative information to be obtained by application of known principles and the importance of this, if Franklin's maxim that a "penny saved is a penny earned" be true, cannot be too highly estimated. In this connection science has been applied most successfully, and wonderful progress has been made, within the last 50 years. From being a wild, reckless, gambling pursuit, in which fortunes were more frequently lost than won, coal mining has been raised almost to the level of an exact science. Thanks to that much-abused branch of human knowledge, paleontology, geology limits unerringly the area under which coal cannot be found. With almost equal certainty it tells us where we may look for it, and what our chances may be that it will be found. If found, chemistry and metallurgy direct us toward the means of ascertaining its value for fuel—whether it will do for ocean steamers, for smelting ores, for forging iron, for steam-boilers, or for domestic purposes. The mission of the geologist, the chemist and the metallurgist is now ended as far as this subject is concerned; and, provided the coal is pronounced a merchantable article, the miner takes up the question and views it from an entirely different stand-point. It is his duty to ascertain the market for this coal, and to what extent it can be used advantageously; he must make himself acquainted with the extent of the coal-field, and, whenever possible, the extent to which the seam may have been faulted or dislocated; he must know the cost of opening the mine, and of establishing permanent works of exploitation; he must know the cost of mining the coal, of getting it to market, and of selling it; he must also decide how, when and to what extent the mine should be opened in order to supply a present demand and be ready to meet the exigencies of the future. As your judgment on these points is correct or false, so will you in your profession stand or fall, and you can easily see that it is only by special training that you can master all the questions that in this one instance would be submitted to the consideration of a mining engineer.

Importance of Mining Interests.

The relations of the Government of the United States toward mines and the mining industry are very different from those of most European Governments. Here mining is free to all, and anybody is at perfect liberty to discover, prospect, and work a mine in such a manner as he pleases. In Europe, however, the case is otherwise, for there the Government either owns and works the mines itself, or else reserves the right to grant or refuse permission to have them worked by others, and in nearly or quite all cases exercises over them a general supervision and prescribes the manner of working. Accustomed as we are in this new country to complete freedom from all Government control in whatever we are pleased to deem our private affairs, this state of things seems strange to us, and at first sight is regarded by many as an unwarrantable exercise of power on the part of a despotic Government, and an interference with one of the "natural rights of man." When, however, in the progress of your studies, you learn how intimately connected the prosperity of many people is with the existence and success of the mines, you will see that in general this state of affairs is the result of absolute necessity, and frequently the expression of a high political wisdom. Such being the case, it was early a matter of importance for Governments to establish technical schools, where the different methods of mining and the principles which govern the administration of mines should be taught, and thus preserve by science and skill an industry so important to the welfare of the State.

Nearly all of these mining schools, whether conducted under the auspices of government or by private enterprise, have obtained a conspicuous celebrity from having graduated so many young men who have in after-life attained eminence in the annals of pure and applied science. To them it is that we are indebted for the great progress during the last 30 or 40 years in the art of metallurgy. The owners of large industrial establishments find it absolutely necessary to employ them if they would compete successfully with their rivals in business. In the sciences of chemistry, geology, and mineralogy, their influence is also felt, whether as professors imparting knowledge, or as original investigators in pursuit of new truths.

In this new connection, and for the purpose of giving an idea of what constitutes the course of study for a mining engineer, the professor gave a brief account of the system followed in two leading mining schools of Europe.

Sudden Stopping of Railroad Trains.—It is claimed that the Westinghouse brake is capable of bringing any ordinary train, moving at from 30 to 35 miles per hour, to a dead halt within the space of 30 feet or in five or six seconds of time; in fact that it is capable of doing anything that is theoretically attainable. The only question is that of inconvenience to passengers from too sudden a stop. It is also asserted that the effects of sudden stops are too much exaggerated, and in proof this is stated that if the feet be placed against the seat in front, with the face to the engine, the train when going 30 miles an hour may be stopped in 30 feet without throwing a greater pressure on our feet than they sustain in walking. Hence, as we may safely trust our knees and boots under double that load, the train might be stopped in 10 or 12 feet, without serious inconvenience. The question then of bringing a train to rest in 10, rather than 20 seconds is perfectly immaterial so far as concerns passengers' comfort, while it may be a vital one so far as their safety is involved.

Mining Property Exempt from Execution.—Few miners are perhaps aware of the provisions of the amended exemption law, passed by the legislature during the session of 1871-2. The fifth subdivision of said law contained in the statute of that term, page 865 reads as follows:

[Exempt.]—The claim or dwelling of a miner, not exceeding in value the sum of $500; also the sluices, pipes, hose, windlass, derrick, cars, pumps, tools, implements and appliances necessary for carrying on any mining operation, not exceeding in value the aggregate sum of $500, and two horses, mules or oxen, with their harness, and food for such horses, mules or oxen, for one month, when necessary to be used in any whim, windlass, derrick, car, pump or hoisting gear; and also his mining claim, actually worked by him, not exceeding in value the sum of $1,000.

Treasure Hill.—Mine Superintendent Maxwell informs us that everything about the Eberhard & Aurora company's property on the hill looks better than has been the case for many months. If the present pleasant weather continues we shall have the 30-stamp mill at Eberhardt constantly supplied with ore and work progressing through the winter. The Ward Beecher company's mine—the Edgar—is improving constantly, and will rank among the best next spring. But little work is being done on other locations there, and it would seem that but little hope exists of any more life being added to them during the coming winter months.—*White Pine News.*

Applied Science—Preparation of Aluminum.—Gerneri of London prepares this metal by placing a mixture of 100 parts of alumina, obtained in the usual way from kaolin, etc., with 40 parts of charcoal, heated to redness, in retorts at a dark red heat, and leading chlorine into them from an iron gasometer lined with lead, and closed with gas tar covered with hydrochloric acid. The volatilized chloride of aluminum formed is condensed in vessels of sheet iron, glazed internally, and is decomposed by an electrical current produced by a magneto-electric machine. The liberated chloride is returned to the gasometer.

To Restore Burnt Steel.—A correspondent of the *Scientific Manufacturer* says: To restore the burnt steel point of a pick, drill, or any similar tool, do not touch it with a hammer, but while it still emits sparks plunge it into cold water and let it remain there until cold. Then reheat to the proper degree and work it. It will then be found as good as before it was burnt.

A New Fossil Plant.—Prof. Schimper has discovered a fossil plant in protogine, a rock hitherto considered as of igneous origin, and found in the form of erratic blocks in the sides of Mont Blanc. The plant is of aquatic nature, and hence the aqueous nature of the rock is rendered probable.

Bessemer Steel is, in some countries, numbered according to the per centage of carbon it contains. Koppmayer finds that each increase of carbon corresponds to a decrease of specific gravity. If this is regular it may serve as a mode of rating the steel.

It is said that experiments recently made indicate that wagons are most easily drawn, on all kinds of roads, when the fore and hind wheels are of the same size, and when the pole is lower than the axle.

Testing Milk for Starch.—Lacto-protein substances have the property of forming a colorless compound with iodine, and not until these are all in combination does starch show the usual blue color.

Blast Furnaces in the United States.—The *American Manufacturer* has reports from 677 blast furnaces of this country; 382 were in blast, and 203 out, on Nov. 1st.

Railroad District.—Smelting Ores,

A correspondent of the Eureka *Sentinel* writing from Railroad district says: Railroad district is located in Elko county, on the eastern slope of the Inskip mountain. It is accessible from several points on the line of both the Central Pacific and the Eureka and Palisade Narrow-Gauge railroads; its basis of supplies, however, is Elko, distant 28 miles from the town of Bullion, the business center of the district. The principal mines are located in a crescent line around the miners' camp, called Highland, two miles to the southwest of the first named place. They may be classified in

Lead and Copper Mines.

The latter contain principally silicate of copper, comparatively speaking a poor copper ore, yet desirable for fluxing purposes, with subordinate quantities of the different carbonates and oxides of copper, and hardly any precious metals. The ores occur in segregated veins or deposits in a dolomitic limestone, and form sometimes networks of considerable extent, as in the instance of the Ella mine, once the most noted of the district. It seems, however, that the working of the copper mines has not been attended by very gratifying results, for the shipping of copper ores has ceased entirely, and but few of the mines are being developed now.

At the present time, miners and operators have concentrated their attention upon the development of the lead mines, and, it is to be hoped, with better success.

The ores of the lead mines form lenticular masses, at or near the contact of the crystalline limestone with a dioritic porphyry and consists of carbonate of lead, and of galena which occurs either in solid blocks or

Disseminated in Ribbons

Throughout the country rock. Their other mineral associates are silicate of copper, red copper ore, brown and calcareous spar, which give the ore a refractory character. Of the precious metals only silver is found in the ore in great varying quantities, ranging from 15 to 150 ounces per ton. The principal mines worked are the Last Chance and Elko Tunnel, belonging to the Empire city company, of New York, and the Webfoot and Tripoli, owned by A. J. Roulstone & Co., of San Francisco. Both companies own smelting works in the town of Bullion, with furnaces similar in pattern to those of this place, only smaller, so as to adopt them to the lesser productivity of the mines.

As before stated the ores of Railroad district bear a refractory character on account of the copper and the carbonate of lime and magnesia they contain. For a successful reduction by smelting it is therefore necessary to introduce: Firstly, the proper quantities of sulphur bearing ingredients into the ore to effect a complete separation of the copper from the lead; and, secondly, silica and oxide of iron to form, with the limestone of the ore, a slag of the required fluidity.

During the Thirty-one Days' Run

Of the Empire City Co's furnace, from October 19th, till November 18th, the first of these conditions could only be partially met at the expense of a large portion of the lead which was consequently lost in the slag. As there is no want of quartz and iron ore in the district, the fulfillment of the second condition did not present any difficulties. Although the furnace of the Empire City Co. is a small one, with three tuyeres and a hearth-area of six square feet only, it melted with the aid of a Root's blower, No. 4, 28 tons of ore and 13 tons of fluxes, equal to 41 tons of material, in twenty-four hours.

In all, there were smelted in the course of 31 days, 23.5 tons of assorted galena, 199.1 tons of second-class ore, 642.8 tons of screenings, from the company's mines; in conjunction with 33.3 tons of quartzose carbonate of lead ore, 8.5 tons trachitic rock in lieu of quartz, 2.8 tons carbonate ore rich in iron, 128.1 tons hematite or red iron ore, 240.7 tons impure slag, and with a consumption of 23,262 bushels of charcoal, and 56,557 pounds of coke.

The result therefrom was 127.8 tons of lead bullion, 27 tons of skimmings—alloy of copper with lead—and 16.3 tons of matte containing 24 per cent. lead, 48 per cent. copper and 58 ounces of silver. This was

The Only Run

The Empire City Co. made during the year. The furnace will be provided with water boxes, and next spring started up again, with coke only as a fuel.

The Webfoot company made but one small run of eight or ten days, during which 120 tons of ore were reduced, yielding 32½ tons of bullion of an alleged silver value of $220 per ton. It is the intention of this company to make another run as soon as iron pyrites can be produced to reduce the skimmings accumulated.

Planetary Distances.—An Armstrong gun throws shot at the rate of 400 yards a second, at its initial discharge. If it should continue on at this rate it would take it 13 years to reach the sun. The rate of motion at which the earth travels in space would take our planet to the sun in 125 days.

The New York *Times* cites the fact that 7,000 mechanics and 2 000 laborers have abandoned the Trades Unions during the last year, as evidence of the declining power of such organizations.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

Machinery.

BALL'S
SWEEPING DREDGE,
A NEW AND VALUABLE
CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company) Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard that the dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

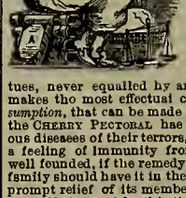
I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

Ayer's Cherry Pectoral,

For Diseases of the Throat and Lungs, such as Coughs, Colds, Whooping Cough, Bronchitis, Asthma and Consumption.



The few compositions, which have won the confidence of mankind and become household words, among not only one, but many nations, must have extraordinary virtues. Perhaps no one ever secured so wide a reputation, or maintained it so long, as AYER'S CHERRY PECTORAL. It has been known to the public ahout forty years, by a long continued series of marvellous cures, that have won for it a confidence in its virtues, never equalled by any other medicine. It still makes the most effectual cures of *Coughs, Colds, Consumption*, that can be made by medical skill. Indeed the CHERRY PECTORAL has really robbed these dangerous diseases of their terrors, to a great extent, and given a feeling of immunity from their fatal effects, that is well founded, if the remedy be taken in season. Every family should have it in their closet for the remedy and prompt relief of its members. Sickness, suffering and even life is saved by this timely protection. The prudent should not neglect it, and the wise will not. Keep it by you for the protection it affords by its timely use in sudden attacks.

General News Items.

Earthquake at New York.—The staid Gothomites were pretty severely shaken up on Thursday night of last week. At Washington Heights it sounded like a prolonged roll of thunder. At Spuyten Tuyvel the people kept lights burning all night, fearing a repetition. The alarm was general in these districts. A rocking and rumbling sensation was felt at West Mount Vernon, White Plains, Mt. Kisco Knisco and Kalanah. Houses shook, windows rattled, and several instances are reported where persons fell out of bed, ceilings cracked and fears were entertained that houses would topple over. Many agree in describing the sound as resembling a terrific explosion. At Dobbs' Ferry houses were violently shaken, and at Bellsrung the concussion lasted five or six seconds. At Mount Vernon the whole town turned out in alarm. Several occupants at the hotel were thrown out of bed. The proprietors were frightened and rung a general alarm. In Rockland much damage was done in broken ceilings and glassware, and many people rushed into the streets in their night clothes. Many persons are seriously indisposed through fear. Cslifornia bide fair to be beaten in what it has heretofore considered one of its special sensationals.

The Back Salary Business.—The aggregate sum voted for back pay by the Forty-second Congress was $1,180,000, of which the opponents of the measure and those who repented of their mistake in drawing it paid back into the National Treasury $240,000. There were 185 members in the House of Representatives who pocketed the back pay, and just 17 of the number have succeeded in being chosen to the Forty-fourth Congress. Forty-nine of those who drew the pay contributed it to the "Conscience Fund." Thie act redeemed some of them in the estimation of their constituents, and 18 of the number were re-elected. Nine of the offenders devoted the amounts drawn to charitable and educational purposes. Five of these were returned. Thus we find that the votere discriminated between the degrees of offense committed, and rewarded or punished the parties implicated, according to surrounding circumstances.

Count Von Arnim.—The evidence in this case is all in. The trial has been the seneation of the hour in Europe. The Count was charged with having abstracted from the Parie Embassy certain State papers which belonged to the public vouchers; but the real offense for which he has been so closely followed by Prince Bismarck is the higher one of disloyalty to that prince minister. The defense of the Count is based on technicalities. He denies his guilt, pleads want of jurisdiction by the Court; also that the powers of the Foreign Office over him had lapsed, because he was placed on the retired list. The first point was overruled by the Court, and the second was decided against him, witnesses being produced who testified that it was an Ambassador's duty to hand over the archives of the Legation to his successor. The final result is looked for by Europeans with much interest and anxiety.

Arbitration.—The libel case of Miss Proctor *vs.* Mr. Moulton, of Beecher notoriety, has been settled by arbitration, without recourse to the Courts. Mr. Moulton admits that he was wrong, and voluntarily purposes to pay damages; while Miss Proctor accepts his apology, and refuses to accept a dollar above costs. The settlement is alike honorable to both parties, and furnishes another step toward the abolition of the uncertain and expensive machinery of courts in favor of a common sense settlement of all personal disputes by arbitration. Probably a large portion of the cases that drag their slow length along our courts could be settled by a three-hours' conference before a Judge capable of expounding the law, if such a tribunal existed.

The International Postage Treaty, about which so much is said and so little known, has for its object the consolidation of all Christendom into one territory for postal purposes, making postage on international letters uniform at five cents, and on postal cards two and a half cents, with an additional charge for long sea voyages. The only hitch in the proposition to pass books from one country to another through the mails at two cents per ounce. This would be free trade in literature, whereat the politicians are alarmed. The Senate will be called to express an opinion upon the subject at the present session, in the exercise of its treaty-making powers.

"Who will be the Next."—Great Britain has made another addition to her empire—this time Grigaa Land has been annexed to her—South African territories. England is spreading out her arms, looking like Victor Hugo's devil fish, and what she gets she keeps. The United States has got land enough; but would it not be well to secure a few more outlying ports as places of refuge for our mercantile and war marine. The time may come, when all or nearly all the ports of the world shall be closed against us; then, if not before, we shall see our mistake in neglecting opportunities.

Mechanics Out of Employment. — Over 30,000 mechanics are said to be out of employment in New York city. This is exclusive of several thousand that are idle on account of strikes among the trade unions. The number of laborers out of employment would swell the grand total to nearly or quite 100,000. The present promises to be a winter of terrible suffering in New York.

Terrific Wind Storm.—Janesville, Lssen county, was recently treated to a terrific wind storm, which tore up trees, prostrated miles of fence, lifted the tops from hay stacks, and blew down barns.

Another rumor is in circulation of more territory for Mexico. This time it is a slice of country between the Rio Grande and the ridge to the south of that river.

Fire.—The house of L. L. Robinson, at Belmont, was destroyed by fire on Thursday morning, of last week, the work of an incendiary. Loss $60,000; insurance, $25,000.

Indicted.—The Napa Grand Jury have indicted E. J. Muybridge, the slayer of Major Larkins, for murder.

Artesian Well in San Joaquin Valley.—The Kentucky artesian well, fifteen miles south of Merced City, in the San Joaquin valley, throws up a volume of water that forms a creek, which runs across the plains ten miles to the San Joaquin river. In summer this stream affords water to five thousand head of cattle, and nearly an equal number of sheep. Its cost was only $1,000.

Indigenous Tobacco.—The tobacco plant is said to grow wild in some parts of Nevada, the stalke attaining a hight of three or four feet. The Winnemucca *Silver State* thinks the spontaneous growth of tobacco in that vicinity indicates that ite cultivation would be practicable there. Some enterprising farmer there should try the experiment. Tobacco is a profitable crop wherever it can be successfully raised.

Immense Coinage.—The coining operations at the new mint in this city are going on with great rapidity. On Tuesday of last week, $800,000 in double eaglee were turned out as a single day's work; $1,600,000 were turned out during Thursday, Friday and Saturday. Friday's work was probably the largest day's work ever done at any mint in the world. The San Francisco mint is a great institution.

A Rattlesnake with 28 Rattles.—Mr. J. H. Lynch, of the American Exchange saloon, in this city, has the rattles of a snake killed in Shasta county about two years ago, which shows twenty-eight rattles and a button. This enake was 31 years old, and seven and a half feet long. A rattlesnake was killed near Marysville, a short time since, with twentty seven rattles.

A company has been formed to work the St. Helena quicksilver mine, consisting of Messrs. Kettlewell, Kenworthy, Van Tassell, Cliff and Tonolla, of St. Helena, and Mr. George Beach of San Francisco. This is the nearest mine to St. Helena.

Two queer fishes, resembling a flounder, but without fins, save two appendagee reeembling hands, as a caudal appendage, were picked up a few daye since on the ocean beach near Mendocino City. It was three feet long, two inches wide, had no scales, and the mouth was merely a gristly tube some two inches in length, been like a parrot's beak.

Railway Cars for Australia.—They are building cars for the Australian market at Troy, N. Y. Propositions have also been received for engines and railroad bridges. How is it that our San Francisco mechanics allow such business to step by them to the other side of the continent?

An Immense Hammer.—What is said to be the largest trip-hammer in the United States has just been completed at Nashua, N. H., at an expense of $75,000. The weight of iron in this mammoth machine is about two hundred tons. The ram weighs twelve tons; its striking force is about one hundred tons.

The Tallest Steeple.—Cincinnati is striking out for the tallest and finest steeple on this continent. It is to ornament a Catholic church in that city; ie to cost, aside from the church edifice, $50,000, and will be 320 feet high.

Duties on Wines.—A large delegation of California wine dealers, whose offices are in New York, is in Washington, to urge the passage of a tariff of 40 cents per gallon on the importation of still wines in caske, and $1.50 on wines in cases.

Apples East of the Sierras.—Applee have been raised at Honey Lake of good eize and well flavored, notwithstanding the assertion that fine fruit cannot be brought to maturity on the east side of the Sierra Nevada.

They have found more coal in Monterey county a few miles east of the claim of the Monterey Coal company.

J. M. Murphy has been elected Recorder of Panamint mining district; 963 votes were polled.

The Vallejo Foundry is working on machinery for a quicksilver mine in Santa Barbara county.

George C. Langtry, superintendent of the Lyon Mill and Mining company, died at Dayton on Saturday.

Fruit to Mexico.—Lusk & Co have recently shipped to Mexico ten tons of fruit from Santa Clara county.

Mining discoveries have been made near Camp Scott, at the head of Paradise valley, Nev.

Street Mining. The truetees of the city of Sonoma, Tuolumne county, having granted J. T. McLean the privilege to mine on Holden street, operstions were commenced on Wednesday back of the Sonora hotel. The Sonora *Democrat* grumbles about it as follows: "We like to seeenterprise make money in mining, but ask ie it proper to allow our streets to be torn up that have cost so much to improve and get in their present condition."

Seene by Mail.—Seeds and cuttings in packagee se large ae four pounde now pass through the mails and post-officee at a comparatively low rate of poetage. A bushel of orchard grass seed weighs 14 pounds, which may be mailed in four packages for 32 cents to any part of the United States.

Agricultural Machinery.—The farmers of the United States annually expend $20,000,000 in reaping and mowing machines. The annual production is estimated at about 125,000 machines.

The mines dealt in at the Stock Board have levied in assessments $29,366,110. They have paid in dividends a total of $56,014,500, leaving a profit of $26,648,399. Who says mining is a delusion and a snare?

Work on the McGlew furnace in Peavine is progressing rapidly. The Masons will be through in a day or two, and then it will take but a short time to get the furnace in complete running order.

Olive Oil.—The olive oil refinery at San Fernando, Loe Angeles county, has commenced operations. Several thousand gallons of oil will be mannfactured this season.

The next annual eession of the State Grange of the Patrone of Husbandry of Colorado will be held in Denver city, commencing on Tuesday, January 13th, 1875.

A rich strike has been made in the Grove mine, at Austin, Nev. The ore body is from twelve to sixteen inches in width, carrying ore of a very high grade.

The Consolidated Virginia and Opbir minee have been obliged to refuse to allow visitors to enter the mines as they greatly interfere with work.

At the Keyetone mine, San Luis Obispo county, they are putting up a new quicksilver furnace and condensers. The worke will be ready to run in about two months.

The Marin county paper mill, owned by S. P. Taylor, is said to be one of the most prosperous manufacturing institutions on this coast.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Dec. 15th, 1874.

For Week Endino Dec. 1st, 1874.*

Step ann Bearino For Mill Spindles.—D. Matthew, Portland, Oregon.

Cuttino Attachment for Sewing Machines.—Marcellus A. Graham, San Francisco, Cal.

Wagon Brake.—John Grider, Milton, Cal.

Blind Bridle.—Francis Schwalm, Clarksville, Cal.

Standing Irrigator ann Revolving Fountain.—Frank J. Shafer, San Francisco, Cal.

Endless Rope Traction Railway—William Eppelsheimer, San Francisco, Cal.

Whip Holder.—John H. Pitts, San Francisco, Cal.

Cesspool Cover and Trap Combined.—John P. Schwartz, San Francisco, Cal.

Trade Mark.

For Sheet and Plate Iron.—Brittan, Holbrooke & Co., San Francisco, Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

"I am the last of six".—One rainy forenoon something less than a year ago, a pale cadaverous, youth walked into the store of C. N. Crittenton, No. 6 Sixth Avenue, and in weak, husky tones, interrupted frequently by a dry, hacking cough, stated that he wanted a couple of bottles of *Hale's Honey of Horehound and Tar*. "I am the last of six," he said, "the others all died of consumption, and I am going fast. I will try this new remedy, but I have no hope." He did try it and to some purpose. He took, in all, twelve bottles, and is to-day in perfect health—lungs sound, cough gone, and not a sign of pulmonary disease remaining.

Pike's Tooth-Ache Drops—Cure in one minute

Woodward's Gardens embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie Seal Ponds, and Skating Rink. Admission, 25 cents; children, 10 cents.

Subscribers who are troubled in getting their papers regularly from the P. O. should be particular to mention the name of the paper.

S. F. Gold and Silver Plating Works, 655 Mission St, advertisement appears first Saturday of every month.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, Britieh Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patente are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will alwaye be as low, and in some instances lower, than those of any other responsible ageucy.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country sooner than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicatione which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasere of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventione also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventione discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventore of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specificatione from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communicatione and business transactions will be held strictly confidential by ue. Circulars free.

Engravings.

We have superior artists in our own office, and all facilitiee for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustratione, and are always ready to assist patrons in bringing their valuable iscooveries into practical and profitable use.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Chas. T. Bell—Alsmeda, Santa Clara and Santa Cruz Counties.

J. W. Anderson—Orange and Santa Ana, in Los Angeles County, Cal.

J. G. Kelley—For Washington Territory.

B. W. Crowell—California.

F. B. Alderson—City agent, San Francisco.

George Decker—Solano County.

J. L. Thart—Southern California.

O. H. Wheeler—Southern California.

A. C. Champion—Tulare, Fresno and Inyo Counties.

D. J. James—Australian Colonies.

J. O. Ewing—Contra Costa County.

John Rostran—Sonoma County.

Don't Stop the Press.—A subscriber in Tulare county, in sending us the renewal of his subscription, adds the following: "Don't stop the Press; I'd just as soon you would stop a portion of my bread. It is a welcome friend to our fireside. Wife is just as deeply interested as I am, and would sooner sacrifice her tea than forego the pleasure of reading the Press. The young Grangers in our family, with sparkling eyes and swift coming feet, gather around to look at the ever new and unfolding wonders to be found in the Press. I repeat it, *dont stop the* Press." D. W.

Visalia, Nov. 3d, 1874.

Mining and Other Companies.

Calaveras Hydraulic Mining Company.

Principal place of business, San Francisco, California. Location of works, Calaveras county, State of California.

Notice is hereby given, that at a meeting of the Trustees of said Company held on the 7th day of December, 1874, an assessment of five (5) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary of the Company in the office of the United States Internal Collector, No. 321 Battery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Saturday, the ninth day of January, 1875, shall be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twenty-fifth (25th) day of January, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale. ABRAM SHEAR, Secretary.

Office, No. 321 Battery street, San Francisco, California. (Over the U. S. Internal Revenue Collector,) San Francisco, Cal. dec19-4t

Electric Mining Company—Principal

place of business, San Francisco, State of California. Location of works, Lincoln Mining District, Butte County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of November, 1874, an assessment of five cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, in San Francisco.

Any stock upon which this assessment shall remain unpaid on the fourth day of January, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday the 25th day of January, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

T. B. WINOARD, Secretary.

Office—Room 13, No. 318 California street, San Francisco, Cal.

"Golden Rule" Silver Mining Company—

Principal place of business, San Francisco, California. Location of works, Ophir Mining District, Utah Territory.

Notice Is hereby given, that at a meeting of the Board of Directors, held on the 8th day of December, 1874, an assessment of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin to the Secretary, No. 530 Clay street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fifteenth day of January, 1875, will be delinquent, and advertised for sale at public auction, and unless payment be made before, will be sold on Monday, the fifteenth day of February, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

K. WERTHEIMER, Secretary.

Office, 530 Clay street, San Francisco, Cal.

Land Purchaser's Association— Office

No. 331 Montgomery street, room 7, San Francisco, California.

Notice.—There are delinquent upon the following described stock, on account of assessment, (Installment No. 42) levied on the 28th day of October, 1874, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

TEATS' PATENT FURNACE.

TEATS' PATENT FURNACE

For Roasting, Deculphurizing, Chloridizing and Oxidizing Ores, etc. For the reduction of Gold, Silver, Lead and other ores, saving a larger percentage, at less cost, than any other invention now in use. Chloridizing Silver ore more thoroughly, in less time, with less fuel, salt and labor; also roasting Lead ore preparatory to smelting, better and cheaper than any other invention. The Furnace is so constructed that one man, of ordinary ability, tends five or more furnaces; controls them with ease; adding heat or air; stopping or starting at will; charging and discharging with case. Also, Patent "Conveying Cooler," for conveying and cooling roasted ores, heating the water for amalgamation and the boilers at the same time. Saving the large space in mill (covered with brick or iron), and the labor of two men per day, exposed to the poisonous chlorine gases. Also, Patent Air Blast "Dry Kiln," for drying ores direct from the mine or breaker, saving fuel and labor heretofore necessary in drying ores for dry pulverizing. For description refer to MINING AND SCIENTIFIC PRESS, No. 18, October 31, 1874. For particulars address

TEATS & BREED,
No. 12 West Eighth Street, Cincinnati, Ohio

Circulars, &c., will be furnished, if required.

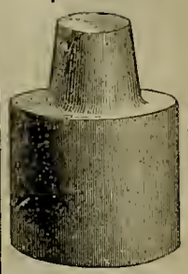
Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.



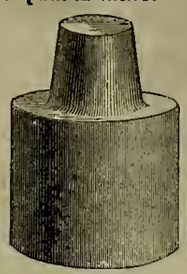
[PATENTED MAY 26TH, 1874.]

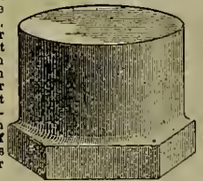
Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

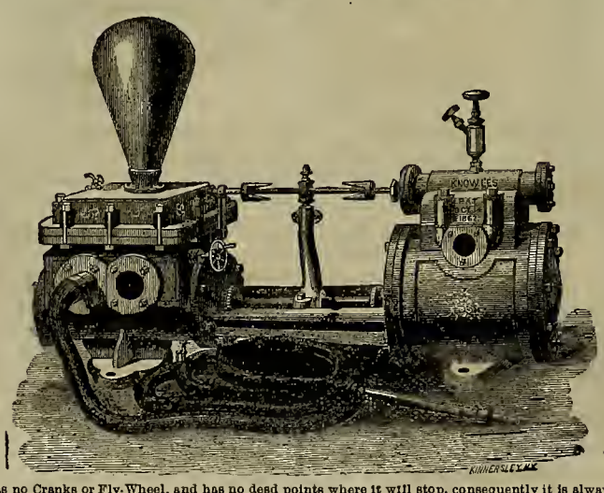
We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.





Address all orders, with dimensions, to
1v29-3m CAST STEEL SHOE & DIE CO., Room 1, Academy Building, S. F

KNOWLES' PATENT STEAM PUMP.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., January 14, 1873.

A. L. FISH, ESQ., Agent of the Knowles Steam Pump—Dear Sir: In reply to your inquiry as to the merits of the Knowles Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have now over 30 of them in use on the road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours, truly, A. J. STEVENS, General Master Mechanic.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a FIRST PREMIUM and Diploma, awarded to Knowles' Patent Steam Pump, as published in the Official List September 23d, 1871.

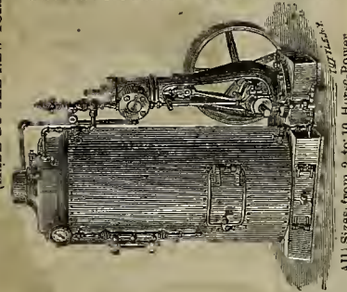
TREADWELL & CO.'S
(IMPROVED)
Upright Safety Engines and Boilers.
(MADE BY THE NEW YORK SAFETY STEAM-POWER COMPANY.)

We would call particular attention to the graceful design and simple mechanism of this Engine Boiler; the form is not only pleasing to the eye, but is, also, that which secures the greatest strength and rigidity with a given amount of material. The Boilers, which are of the Upright Tubular style, with internal fire box, are of the best material and workmanship, and are all tested to 150 pounds per inch. Two safety valves are used on the Engine, and the Engine is usually allowed to carry 100 pounds pressure, but it is therefore unnecessary to purchase a greater rated power than is actually required, while in cases of emergency these boilers can be depended on for more than their rated power. The Engine is not fastened to or upon the boiler, and is therefore not affected by expansion, nor are the bearings overheated by conduction, or the heat from the boiler. The fly-wheel being at the base secures perfect steadiness under the high speed which is necessary for economy of fuel. All parts are easily accessible—a great advantage. Is complete in itself as a Portable Engine and Boiler, or the Engine can be detached from the Boiler and run independently, if required. For price, terms, and other particulars, send for circular. Quantities of small repairs always on hand. Safety and a small repair or machine shops, or for boiling, wherever small and safe power is required, they are peculiarly adapted. Over 500 are already in use.

TREADWELL & CO., Sole Agents, S. F.

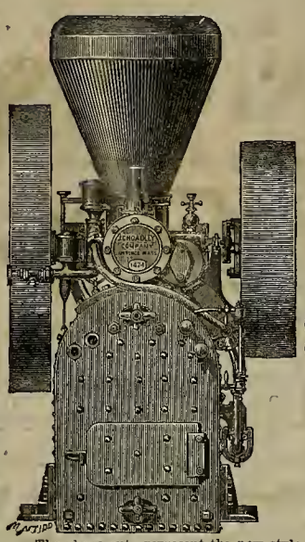


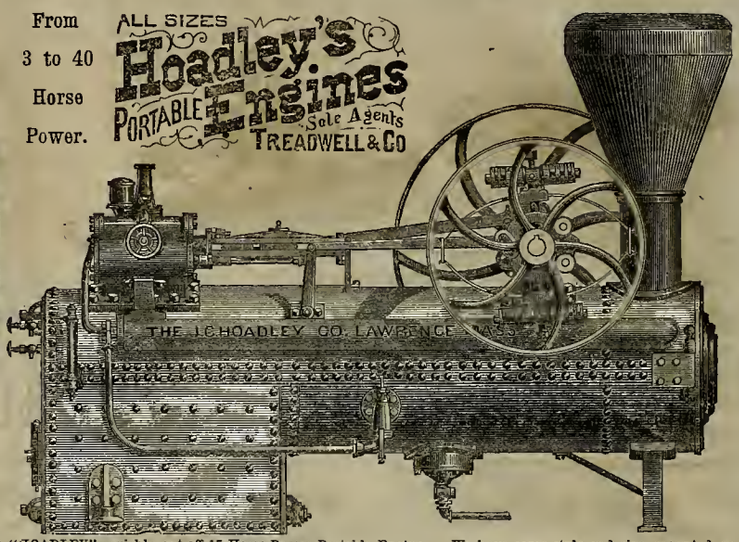
All Sizes, from 2 to 10 Horse-Power.

THE "HOADLEY" PORTABLE STEAM ENGINE.

From 3 to 40 Horse Power.

ALL SIZES Hoadley's PORTABLE Engines Sole Agents TREADWELL & Co





The above cuts represent the new style "HOADLEY" variable cut-off 15 Horse-Power Portable Engine. We have same style and size mounted on wheels as a Threshing Engine for the Russell End-shake Separator. We have all sizes from 3 to 40 horse-power on hand. The HOADLEY ENGINES need no recommendation from us. We have sold them in California for 20 years, and every year has added to their improvements. The last great improvement is the Cut-off Governor, thus giving them all the economy and increased power of the most thorough built stationary engine.

☞ Millmen, Mine-owners and Mining Superintendents, and all who intend buying engines, will do well to examine carefully the merits of the "HOADLEY" before purchasing. Circulars and prices sent free on application. Address

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering two or four sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, haryta and quartz; and pyrites from quartz.

Added to a battery of stampa these machines constitute a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 15 or 20 tons per 24 hours.

For particulars apply to,

F. CAZIN, M. & C. E.
Supt. Denver Concentration and Smelting Co.

At Denver, Colorado, Lock-Box 2225, or corner of Blake and 32d streets. ag3-16p

VOLUME XXIX Number 26.

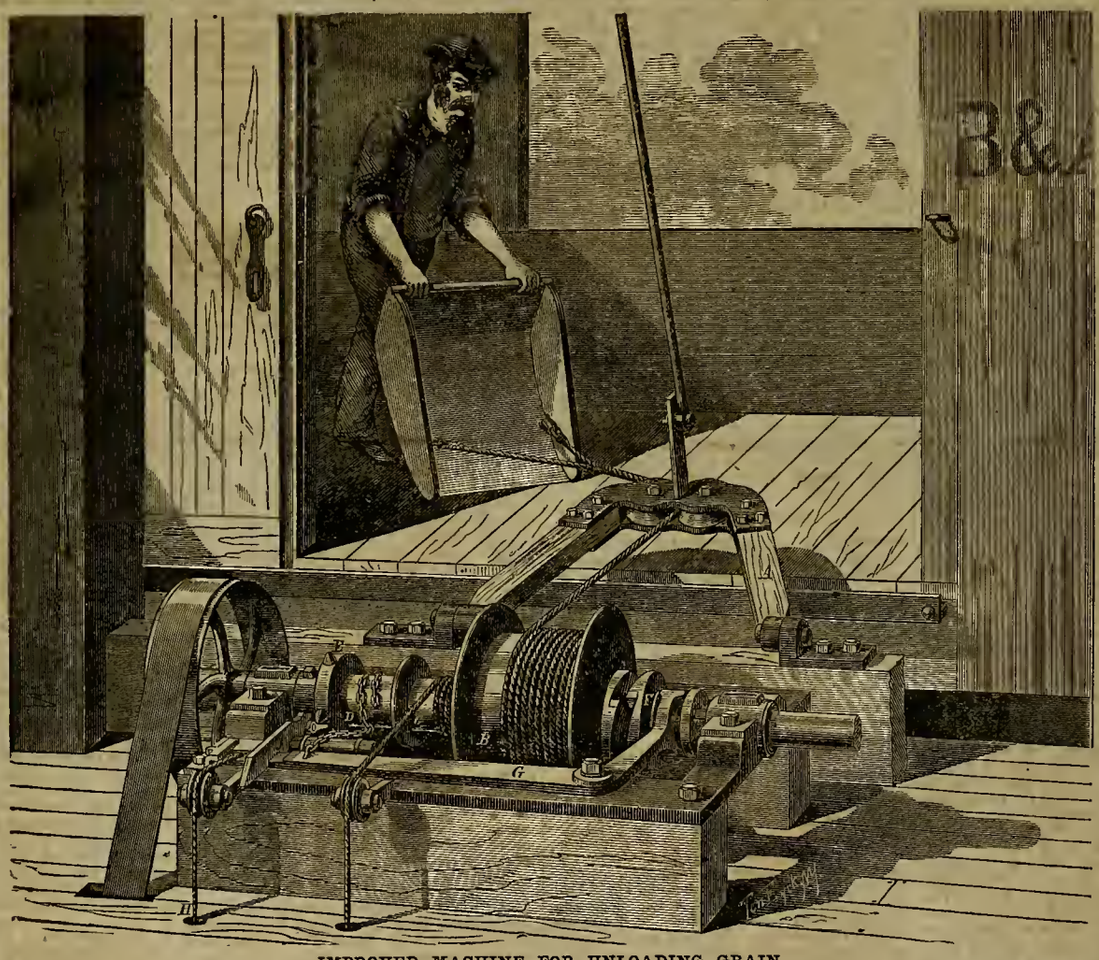
Improved Machine for Unloading Grain.

The apparatns illustrated in the annexed engraving is designed for use in connection with grain elevators or warehouses, and its object is to afford a speedy means of removing the grain from the cars in which the staple is transported. The device is claimed to effect a aaving of from three to four-fifths of the labor incident to nnloading. The large scoop or shovel shown in the hands of the workmen in the oar is provided near its lnwer edge with hooks, to whioh is attached the rope leading from the machine. The rope passes between the sheaves of a fair leader, A, the arms of which are hinged to a beam on the floor of the warehouse, so that when the apparatns is not in nse, the portion, A, may be placed in a vertical position, or tnraed back ont of the way. When the car comes alongside, the fair leader is turned down horizontally, as shown in the illnstration.

B is a drnm to which are connected the barrels on which wind the cord, C, and chain, D, and also the tappet disk, E, the whole being loose on the shaft to which power is applied by means of the belt pnlley. To the right of the drum is a clntch, F, feathered to and revolving with the shaft. G is a pivoted bell crank lever, one arm of which embraces the clutch, F, while to the other arm the chain, D, and a rope, H, are secured; the latter passes over a pulley and down through the floor, and carries a weight. The cord, C, is also similarly arranged. As represented in the illnstration, the operator is drawing back the shovel, the clutch, F, is now disengsged, the drnm, B, revolves freely on the shaft, so as to pay ont the rope thereon, and the cord, C, is thus wonnd aronnd its barrel; the chain, D, by the same motion, is unwonnd, while the tappets on the disk, E, striking from below against the pallet, I, on the latch, J, lift the former as each tappet passes. When the workman has drawn the shovel back to any desired distance, he pushes the edge of the shovel into the grain, aad slightly slacks the drag rope. This allows the drum immediately to be rotated in the opposite direction, by the action of the weight on the cord, C. The resnlt is that as the tappets on the disk, E, strike the pallet, I, from above, the latter no longer yields, but is carried down, thereby lifting the pivoted latch, J, and freeing the end of the lever, G; at the seme time the chain, D, being nnwonnd from its barrel, allows the weight attached to rope, H, to pull the end of the lever, G, outward; thns, as is evident, throwing the clntch, F, into gear with the drum, B. The drum now rotated by the belt wheel winds np its rope, and in so doing, drags the scoop, gaided by the workman, toward the edge of the oar, and thus hauls a large quantity of grain out through the door. Mesnwhile the chain, D, is being wound np, and its length is so adjusted that when the shovel has reached the door of the car, the tightening of the chain pulls the end of the lever, G, inward, thus throwing the olutch ont of gear. At the same time the latch, J, falls over the lever as before, holding it in place, when the parts are once more in the position noted in the beginning of the description, and the same operation is repeated.

The main drnm makes, we are informed, about fifty-five revolutions, and winds np one hnndred and forty-five feet of rope per minnte, so that the nnloading is accomplished very rapidly, and with no other labor than that of the single hand gniding the scoop.

In large grain honses several mschines may be employed upon one line shaft extending



IMPROVED MACHINE FOR UNLOADING GRAIN.

past a nnmber of elevators, and where necessary the apparatus may be arranged overhead. Single machines, like the one illustrated, may be used; or double machines, enabling two workmen to operate in one car at the same time, as circumstances may require.

The device is in use in the largest elevators of Chicago, Milwaukee, East St. Louis, Peoria, Detroit and Indianapolis; and has recently been introduced into the Grand Junction elevator of the Boston and Albany railroad, at East Boston, Massachnsetts, and also into the elevators of the Interaational Navigation Co., at Philadelphia, and the Baltimore and Ohio Railroad Company, at Baltimore. For fnrther partionlars, address T. L. Clark, Newark, Licking connty, Ohio.

The acid and blaostone factory at Carson, lately destroyed by fire, is to be rebailt. The dimensioas of the new building will be 140 feet loug, 24 feet wide and 24 feet high. All that part conteining engines, crusher and tanks will be of brick.

The new air shaft on the Belcher mine ie now down 127 feet, and the upraise to connect with it is progressing rapidly.

Academy of Sciences.

The regular meeting of the California Academy of Sciences was held last Monday evening. Among the donations were three jars of specimens obtained ia the deep sea sonndings. The lattter were left at Mare Island by Captain Belknap of the "Tuscarora", and sent to the Society by Admiral Rodgers with a letter of explanation. The specimens will be examined by Dr. Harkness of the Microscopical Society. T. J. Lowry read a short hnt interesting paper on the "Astronomical Clock," which is referred to at length in another colnmn. A large and valuable collection of lithographic engrevings and books was received from the Smithsonian Institate. The oommittee appointed to nominate a ticket for officers to be voted for at the annnal election reported. The regular nominations are as follows: President, Prof. George Davidson; First Vice-President, Henry Edward; second Vice-President, Henry Gibbons, Sr.; Recording Secretary, Charles G. Yale; Corresponding Secretery, Henry G. Hanks; Treasurer, Elisha Brooke; Librarian, Wm. G. Fisher; Director of Maseum, Albert Kellogg; Trnstees, David D. Colton, George E. Gray, Robert E. C. Stearns, John Heweton, Jr., Ralph C. Harrison, Wm. Ashburner.

Jersey district, Nevada, which has been almost abandoned for two or three months past, begins to exhibit symptoms of reanimation. Captain Taylor, of Galena, one of the locators of the Jersey mine, has sold his interest to J. A. Blossom, of Bsttle Monntain, for $8,000, and negotiations are pending for the sale of the balance of the mine.

Mining in the Southern Counties.

The sonthern part of the State of California has never been a favorite locality for prospectors. Unfortnnately, what few mines were fonnd, lacked the necessary capital to be put on a good footing, and it has been difficult to sell any mining property located there, no matter how good. People have an idea that mines of valne are seldom fonnd except in inhospitable regions, and that as the southern part of the State had such great climatic advantages, it was hardly possible that anything worth much would be found. In San Diego, San Bernardino and Inyo connties, good mines have been worked for several years, bnt the mining districts were, as a general thing, not very prosperous.

A new era of prosperity is now opening, however, for the miners in the southern counties, and the Penamint excitement will do mnch to help it. Already we hear of new discoveries having been made, and the overflow of prospectors at Panamint in the spring will canse others to be made. Heretofore it has been difficult to get any capitalist to invest in the southern counties. If miners were able to get anyone with money to put up a simple ten-stamp mill for half a mine, etc., the mine owners were considered in very good luck. Most of the miners down that way are hard np, as miners in all quartz camps are, unless capital is with them, and in many cases have given up really good mines in pure disgust at the apathy of capitalists. At present, however, the feeling in the mining districts of the southern counties is a cheerful one, as a prominent capitalist has invested in the region and others will be likely to follow his example. Many of the miners who have gone to Panamint will probably prefer prospecting to working for wages in the spring, and the mountain will be pretty thoroughly searched daring the snmmer months. Heretofore it really has not been worth much to any poor miner to find even a first-class ledge in the southern counties, nnless the rock was rich enough to be pounded ont in a hand mortar, for he could get no one to help him out in working it. Now, with a few flourishing districts neer at hand, they will have a better opportunity to place their properties before capitelists, and will go to work prospecting with renewed vigor and hope.

Bro Work.—The progress made in the main header of the Sutro tunnel for the week endiag December 19th, under the able management of Assistant Superintendent Jackson, with *four* Burleigh drills, was 106 feet. The header ie 8x8. This is the quickest work of the kind ever done on this coast. They expect soon to be able to make 450 feet per month in the header with the four drills. If they keep on at this rate it will not take long to reach the Comstock lode.

The new and principal machinery ordered for the Baltimore mine, on the Cometock, is arriving at its destination.

CORRESPONDENCE.

Tybo---Its Mines and Mineral Resources.

EDITORS PRESS:—Having in your last week's issue glanced at a few of the surrounding camps, and described some of the improvements which have been brought here since last April, under the direction of Mr. McGeo, I will now try and convey to your numerous readers some idea of the condition of the mines, the geological formation of the country, town, location, etc. But first it will be necessary for our purpose that we have something to say in connection with the much needed and

Costly Improvements

Which have been for some time past projected, and which are to be completed by the 1st of next May. The first and by far the most important of these, is a new 20-stamp mill, with a 150 horse-power engine, boilers, etc., which is to cost $60,000. The mill and machinery are already contracted for, and some of their ponderous appendages are already in transit, and will be here in a short while. Its site is fixed upon, and the grading for it commences at an early day. It is to be a wet crusher, and will add much to the value of the company's property.

The next most important undertaking on the tapis is the immediate erection of a 60-ton cupola, to the east of and adjoining the present structure. There is also a calcining pan in place, which is to be utilized as soon as there arrives in the camp lumber enough to cover it in from the elements. Here the impurities will be removed from the crude bullion, and when thus cleansed of the foreign substances, it will then be ready for the manipulations of the refiner, whose department adjoins the calcining one. This refinery will be of immense advantage to the company, for it will not only give it the pure commercial basis against which checks can be drawn at will, should a fresh supply of the circulating medium be needed, but it will also give it a plentiful supply of litharge for smelting purposes, should the galena ores from any cause run short. These checks, too, when so drawn, will stand in no fear of being dishonored, when presented for the express, or shipping receipt, will always stand out boldly in the relation of a good and sufficient *quid pro quo*, for the metallic favors that may be required from its financial agents.

Geological Formation.

The country hereabouts presents many geological and mineralogical features worthy the attention of the practical miner and scientist alike. This region is extremely mountainous and hilly, and bears in every direction in which it has been explored, ample evidence of the presence and general diffusion of the precious metals. These are not, however, always found in sufficient quantities to remunerate the thousands of the sturdy sons of toil who, in this wintrish clime, through icy storm and under the fierce glare of the summer's sun, delve deep into bowels of the earth, and penetrate the rock-ribbed sides of almost inaccessible mountains, in their search after them. The privations and hardships incident to the prospector's life amidst the rugged and barren looking mountains of this State, are of no ordinary character, and nothing but the love of gain and the ardent desire to possess wealth, that is implanted in the human heart, could or should induce a man to wander for years away from the refining influences of civilized life in a will-o-the-wisp chase after the wealth and fortune which, by some, are never found.

The hills are at present clothed in the purest of "ascension robes." Snow on every side, but not in such profusion as it was at this period last winter. This, at least, is comforting. The country rock, as far as I have been able to discern during my short sojourn here, appears to be an admixture of lime, decomposed slate, granite and porphyry, the two latter, however, predominating. These, as we know, are always favorable to argentiferous deposits, while there is sometimes but very little affiliation between silver and lime. In some instances, however, well defined fissure silver veins have been found to preserve their uniformity, outline and depth, and to yield as largely and larger in limestone formations than in either granite or porphyry, yet for all this we are well aware that a purely limestone formation is by no means favorable to the presence of fissure veins.

Now for a hasty glance at the company's mining property, particularly the celebrated

"Two G."

This famous mine contains 1,200 lineal feet running southeast from the point of discovery, over a rocky, lateral ridge of the elevated hill upon which it is located. This hill rises rather abruptly to the south of the canon, some 1,600 feet by actual measurement, and presents to the eye of the beholder a bold, grand appearance, and affords from its rocky apex a magnificent view of the surrounding wintry landscape. The morning after my arrival I was taken in tow by Mr. James Hudson, the courteous and obliging mine superintendent, who is an experienced, reliable and practical miner—and escorted to view the mineral wealth he has been instrumental in bringing to light. The Two G mine or vein is at present writing opened by a series of three tunnels to a depth of 245 feet, from the highest point of the outcrop of the vein. The average depth is, however, not more than 188 feet to the level of tunnel No. 1, allowing for the irregularities of elevation in the hills along the course of the lode. These tunnels are designated as tunnel No. 1, 2, and 3. No. 1 was commenced by the present manager, last May, and has since attained a distance of 163 lineal feet along the course of the vein. There appears, as far as I have seen, to be over 200 feet of this space which contains smelting or galena ores exclusively, while the remainder carries a kind of dark, partly decomposed quartz, which will mill readily without being roasted. This class of ore assays from $35 to $100 per ton; the latter figures are, however, not always obtained Forty dollars will more nearly approximate to its real working yield. Should it mill up to these last figures, or even give net returns of $30 per ton, the profits would be enormous, for the cost of mining, sorting, hauling and milling will not exceed $7 per ton, and this, I think, is an extreme figure. This one, I observe, carries some sulphurets, but not enough to interpose any great obstacle to its being readily and profitably worked. It will certainly need no roasting, which is quite a desideratum with mill men.

Tunnel No. 2, 40 feet above tunnel No. 1, located at the point of original discovery, has been driven along the vein over 500 lineal feet, disclosing the same quality of ore met with in No. 1, and like No. 1 has cut through one or two large chimneys on its course. These milling ore chimneys occur at regular intervals and in such places they open out laterally to seven and eight feet, and in some instances no walls were found even at these distances. These chimney expansions exercise no material influence upon the course or uniformity of the lode, which continues unbroken. Tunnels Nos. 1 and 2 are connected by a winze through which all the ore mined and to be mined above No. 1 is passed down to that level, from whence it is run in cars to the ore bins that are constructed at its outer orifice, to be from thence conveyed to the furnace as aforesaid.

Tunnel No. 3 is still higher up the hill towards the highest point of the lode, which it has penetrated about 100 feet. Here there is found unusually rich smelting ore. It will yield $200 per ton, and there are several hundred tons of it exposed to view ready for the pick of the miner. From this point to the opening of tunnel No. 1, the lode is developed to an average depth of 188 feet, and the lineal distance between the two points indicated is a trifle over 500 feet or five twelfths of the entire 1,200 feet of the Two G lode, and but one-sixth of the whole lode embraced within the limits of the Two G Casket, Lafayette and Crosly mines, all of which aggregate 3,000 feet in length.

The Casket and Crosly

Are immediate extensions of the Two G vein, while the Lafayette appears to be nothing more than an offshoot from the former for the same quality of ore and the same kind of vein formations are found as far as the vein is explored. It is opened by a 70 foot shaft and a drift 75 foot in length run to the south east along the vein. The vein is in all respects the same as the Two G, Casket and Crosly, and the walls are well defined as far as uncovered.

From the level of tunnel No. 1, (Two G mine), two incline winzes have been sunk a distance of 75 feet each below it. This is the first level below No. 1. These winzes are 163 feet apart. They are now connected underneath by a spacious drift run through the lode, which at this depth is not only thicker, but richer, and also more uniform in its general character. The tunnels and drifts, thus far opened, show a solid well defined ore vein of an average thickness of four feet, running down at an angle of inclination of 75 or 80 degrees, encased between perfect foot and hanging walls, composed of porphyry and silicious lime. The outcrop of this vein has been traced more than 5,000 feet southeast and northwest. The aforementioned winzes, the outer one of which is now down 110 feet, give further proof of the permanency and value of this property, the lode is penetrated and defined to an average depth from its outcrop, of 298 feet, and it is still descending. I will here, for the sake of argument, and by way of illustration, make an estimate of the amount of ore which the Two G vein should alone produce, provided it yielded throughout its lineal extent and depth as far as opened, (298 feet), the same as it is at present, and preserved also the same thickness, (four feet,) and uniformity of character. By cubing these figures I find a product of 1,430,400 cubic feet, which I divide by 15, the number of cubic feet in a ton of this ore, to bring them to tons, and I still have before me the enormous amount of 95,360 tons of ore, representing a coin value of $2,860,800. These figures are based upon the ore yielding a net value of $30 per ton, and this it will do, seeing that it works at present from 30 to 40 per cent. above this amount.

But since some persons may object to my taking or including the undeveloped portion of the lode, lying to the southeast, I will strike it out altogether, and confine myself to the 550 feet which I have shown is developed to a depth of 298 feet. Cubing, as before, I have a product of 655,600 cubic feet, which, divided by 15, as before, leaves a product of 43,706⅔ tons of available ore, which, at $30 per ton, as aforesaid, represents a sum equal to $1,311,200. This calculation would leave ten dollars per ton to cover the expenses incident to mining, hauling and reducing it, whether by mill or furnace; and this I know is a big margin, seeing that the ore is easily extracted and cheaply hauled to the place of reduction.

It will be well to state right here that I have gathered the following interesting data from the books of the head smelter and assayer, who is also an experienced, practical refiner, and a good furnace man, Mr. L. Hart. From this it appears that the furnace was set in motion for the first time on the 24th of August last, and run 59 days altogether up to the 1st instant, and reduced 1,260 tons of ore, which yielded 153 tons of bullion, valued at $612,000, or $400 per ton. This showing would bring the value of the ore to a fraction under $49 per ton, or $9 more than I estimated it at. The furnace runs were as follows:

	Days.	Ore tons.	Bullion tons.
August	8	145	20
September	18	355	45
October	15	340	40
November	18	420	48
Total	59	1260	153

These are highly encouraging facts worthy the attention of the public, as they demonstrate the value of these mines, and also foreshadow the brilliant future before the company who own them.

There is a noticeable feature and a singularly strange one too, that I cannot pass over, that has struck my attention in connection with this Two G lode, and it is this: That the milling and smelting ores run parallel to each other along the vein, the line of separation being well defined, the former hugging the foot wall or porphyry side, while the latter clings with equal fondness to the hanging wall, or silicious lime side. Will some of your readers, skilled in mineralogical science, explain the cause of this unusual occurrence.

There are thousands of tons of ore now in sight, that are held as reserves by Mr. Hudson, the foreman, against accident of any kind, though he does not anticipate the immediate "petering out" of the lode.

A New Shaft

To connect with the interior of the mine is now being sunk about 150 feet to the eastward of tunnel No. 1, through which all the ore, mined below the level of this tunnel, will be hoisted. A small portable engine is to be soon placed over it, to facilitate its being sunk to the desired depth. When this is attained, new and powerful hoisting gear will be permanently fixed over it.

This valuable property has recently been incorporated in the great mining and stock jobbing mart of the world—London—under the name and style above set forth, with a capital of $1,200,000. It is incorporated under the Limited Liability Act. Its incorporators have not as yet placed the venture on the market, and they will not either till the mill and second furnace shall have been completed and set in motion. Then this grandly conceived and grandly developed mining enterprise will be brought prominently, for the first time, before the London public, to sink or swim upon its own merits, the same as the other valuable and deserving mining properties that are held in this State have been doing. It is not, however destined to ingloriously sink beneath the waters of either adversity or oblivion, but to swim buoyantly onward on its course, gaining at each successive stroke renewed success and prosperity.

Now a word or two in relation to the altitude, town locations, etc., and I am done. The

Altitude

Of Tybo is not much if anything below that of Eureka. The latter town ranges about 6,000 feet above salt water, and I think the former place is not much less. The elevation of the mines is, of course, much greater. We have three embryo

Towns

Here, each struggling for supremacy, and each putting forth vigorous exertions in the race for future metropolitan destination. These three incipient segregations are denominated Upper, Lower and Middle Tybo. The lower town is being built along the canon, which here runs east and west. Here are situated the Tybo company's works. The middle town is located some distance higher up the canon at a point where it debouches abruptly to the northwest. This is the happy elysium of the "soiled doves," the sporting fraternity and the professional loafers generally, who have bid an eternal farewell to labor of any kind.

The upper town is situated about half a mile farther up toward cloud land. It is being built on a kind of open plateau where wood and water are abundant. These two upper towns are, however, destined to both blossom and decay in the same season, without I am mistaken. That they will not, at all events, become grey and over antiquated from the dust of accumulated years, is certain, for the principal place of business will of necessity be in the vicinage of the company's works.

We have three stores, one in each town, a postoffice, no express office, a blacksmith's shop, a "tiger den," a lodging house, a feed and livery stable, a restaurant, and last but not least, we can beat of innumerable places devoted to the sale of the ardent, where it is dispensed with lightning effect, by "gentlemanly barkeepers." We are also on the *qui vive* for the advent of a hurdy gurdy troupe to do the light fantastic for the boys. From the above it will be seen that Tybo, though a new and isolated place, is by no means behind more favored places in all elevating(?) influences.

In Conclusion

What more can be said? Nothing, only that Tybo is destined to find a distinguished and conspicuous place in the mining annals of Nevada; for its mineral wealth, its geographical position, in the center of a vast mineral bearing region, with easy approaches to it, will entitle it to the distinction. And whenever this is to be done, the names of the originators of the above venture, who have spent their money in its development making the wilderness to teem with life and motion, and the lonely cañons to echo to the music of the hammer and drill, will be associated with the event. I have been six years in this State and have in that time visited many mining localities, and inspected many of their leading mines, and I honestly confess that in all my erratic rambling I have never seen a more finely developed, or a more elegantly outlined vein, and taken on the average, better ore than is found in the above described property.

The company is working at present 85 hands, between mine and furnace, but this number will, in a few weeks, be immeasurably increased. J. D. POWER.

Tybo, Nye Co., Nevada, Dec. 4th, '74.

CHANGING SMOOTH BORE CANNON TO RIFLES. A series of important experiments is now in progress at Sandy Hook, for the determination of the merits of the new plan of changing smooth bore guns to rifles by the insertion of a coiled wrought iron cylinder, secured in position by a collar at the muzzle of the gun. A 10-inch smooth bore is thus converted into an 8-inch rifle. If the system prove successful, it will enable the government to utilize a large number of guns now useless. The casemates of almost all the fortifications of the United States have been built of a size admitting no larger piece than the 10-inch cannon, and it has been suggested that, by a steel cylinder instead of one of wrought iron, a gun of the above caliber may be altered even to a 9-inch rifle. Experiments thus far made demonstrate that while the 10-inch smooth bore used a projectile weighing 127 pounds the same gun altered to a rifle gives nearly double the force, a more even rate of speed, greater penetration and increased accuracy with a shot weighing 187 pounds.

NEW OREGON MINES.—Advices from Rock Point, Oregon, dated Dec. 15 state: J. L. Colvig and James Birdseye have just arrived from the new quartz mines, some fifty miles below this place. They say the road is lined with men and pack trains going to the land of gold and silver. The great Mammoth ledge is about 180 feet in width at the point where Rogue river has worn its way through to the depth of 500 feet. About 200 claims are now taken up. It has been traced for about 20 miles through a very rough country. Guides get from $10 to $20 per day to trace the lead.

HANDLING SUGAR BEETS.—It is well known, beets, when taken from the ground for the manufacture of sugar, undergo a rapid deterioration in their saccharine properties. As soon as they are removed from the earth they begin to give off carbonic acid and take up oxygen. The carbonic acid is a product of the oxidation of the sugar contained in the beets. According to calculation 1,000 cwt. beets would lose 10 cwt. sugar in 30 days. The air contained in the beets consists mainly of nitrogen and carbonic acid, and very little oxygen.

LICK OBSERVATORY.—A Washington depatch says Professor Simon Newcomb has been requested by the Trustees of the Lick Fund, to determine where and for what price the great equatorial telescope may be constructed which is to be the pride of the new California observatory. He will sail for Europe in a few days on duty for the National Observatory, and will visit Lord Rosse's Observatory in Ireland, and Paris, Berlin and other noted observatories.

HOW LONG WILL SOILS RETAIN EFFLUVIA?—At the late meeting of the American Medical Association, Dr. Bell, of Brooklyn, to show the unlimited time in which saturated alluvial soils retain their deleterious influences, related a circumstance of the digging up of the mastodon at Cohoes, New York, some years ago, the effect of which was to make the workmen sick from the stench arising, notwithstanding the fact that it was but a young mammoth, and had been buried only about 40,000 years.

WORKING GREEN WOOD.—A correspondent of the *Scientific American* says: Some of my brother wood-workers may not know that the difficulty of finishing a small piece of green wood, as is sometimes necessary, may be overcome by scorching the piece after it is shaped ont. A few lighted shavings will do, and you can then file and sandpaper without trouble.

A FREAK OF NATURE.—It is said that in a recent gale on Lake Superior, an island two acres in extent, on which the pine trees were three feet in diameter, was displaced by the waves, and floated a distance of three miles into the harbor of Duluth.

THE Salt Lake *Tribune* says that $100,000 was invested in Bingham cañon last week by Californians.

MECHANICAL PROGRESS.

Singular and Important Phenomenon in Regard to Iron.

At a late meeting of the Car-builder's Association, held in New York, Nov. 19. Prof. Thurston referred to a singular phenomenon which had been observed while making some experimental tests in Washington. A piece of iron was being subjected to a tensile strain by means of an eye welded to each end of the piece. When the limit of strength was apparently reached, and a sensible contraction of the circumference indicated that the piece was about to break, the weld holding the eye gave way and caused a postponement of the test until the following day, the eye being in the mean time welded on again. On renewing the test, the iron, instead of parting at the weakened spot, as was expected, sustained an additional strain of 20,000 pounds, and then parted at the other end, where no signs of weakness had been visible the day before, showing that the weakened part had actually gained in strength during its period of rest.

This was so remarkable that much attention was attracted to it, and subsequent experiments demonstrated that this property of regaining and increasing strength after resting from strain, was possessed by all good irons. Prof Thurston had himself made experiments of this kind, and exhibited diagrams showing that after iron had, under strain, passed the limit of elasticity and ductility, if the strain was taken off for five minutes even, and then applied again, the line on the chart would indicate an increase of strength. This occurred repeatedly with the same piece of iron; the longer the rest, the more evident was the increase of strength.

Mr. Hopkins wished to know if in such a case the strain were continued, the increase of strength would be permanent; or whether the metal would finally weaken at the point where the partial separation of the particles had taken place?

Prof. Thurston replied that that point had not yet been demonstrated, but his theory was that the added strength was permanent.

Mr. Snow asked if the point in the iron first referred to was not heated during the rewelding; and on being answered by the Professor in the affirmative, said he believed that the renewal of strength was due to the reheating.

Prof. Thurston said he supposed the reheating might perhaps restore the strength and leave it where it was before; but the fact that it held firm under a much higher pressure, until the iron broke at another point, showed that it was stronger than it was before.

Mr. Hopkins asked if the increase of the strength of iron when manufactured into wire was due to this *setting* process. He thought these experiments and tests would be productive of valuable results in the manufacture of iron.

Prof. Thurston said he could give an illustration by relating a recent experience. A gentleman in Pittsburg engaged in experimenting with Bessemer steel, sent him from time to time specimens to be tested. The results of the tests were sent to the experimenter but without knowing in what direction the experiments were tending, until one day the gentleman called and said he had succeeded by means of the tests in accomplishing what he wanted, and which was to ascertain what mixtures he must use to increase the ductility of the iron in order to make a better gun-metal. By looking over the diagrams he could see what effect his last mixtures had produced in the iron, and what modifications were necessary, until he had obtained the desired results.

Mr. Forney asked how much stronger wire was than the original metal.

Mr. Hopkins replied that he did not know, but it was a great deal stronger. He had some iron sent him which would stand 66,000 pounds to the square inch, and the wire from that grade of iron ran up to 99,000 and 105,000 pounds to the square inch, and he did not know but it would reach 120,000.

Mr. Partridge said some of the finest wires would more than double the strength of the original iron; and asked if cold rolled shafting would not get some of its stiffness and strength from the process of which they had been speaking.

Prof. Thurston replied that he presumed it would.

Mr. Forney inquired it the strength of iron coupling-links on cars was increased by use.

Mr. Hopkins said that the links were so worn by constant use that it would be impossible to tell. A grass scythe with an edge so brittle that it would break in cutting the brush, etc., growing with the grass, if hung up for a year or two out of doors and allowed to rust, would invariably be found to be in excellent condition when ground up again for use.

Prof. Thurston said that old chisels that had long been exposed, proved to be very good and very tough. He once found an old corn-knife in a scrapheap, which held its edge wonderfully well when ground up. He thought the improvement of the metal, when exposed to the the weather, might be due to the action of carbon.

Mr. Partridge had read in the *Annual of Scientific Discovery*, for 1855, an account of a series of experiments with some car-axles: a man had taken a set of axles in constant use, and another set that had had long intervals of rest, and compared their mileage, and it was found that the latter rendered longer and heavier service than the former, which were, under the very same circumstances, all the time at work.

Mr. Adams thought the improvement of the scythe by exposure was generally known and admitted among farmers: but of course, no one had any idea as to the cause. He believed the theory to be correct, that it was due to the removal of the carbon.

Prof. Thurston suggested that it might be partly owing to the fact that, in working the scythe, it receives a certain amount of internal strain, and when it was put into the market, it had not been relieved of any of this, but might be, by the means stated, to some extent.

Mr. Hopkins said that in the light of the experiments of the evening, he concluded that if the iron were drawn down under a strain of extreme tension, and in that condition hammered, a still greater compacting of the fibers would occur, and probably a vast increase of strength would be obtained.

Prof Thurston.—Hammered under a strain?

Mr. Hopkins.—Yes, sir; distributed over a large surface, and tending to compress the fibres for a long distance.

Prof. Thurston.—That might be the case. But one thing is a fact; it a piece of metal is heated up to a cherry-heat, and a strain put on it which is about as much as they expect it to bear, and then they take it and break it cool, it will bear a greater tension than they expected, before it will break. The increase of strength is almost always observable, and generally amounts to 10 or 15 per cent. This was shown by the experiments of a committee. They simply strained the iron to the point it ought to bear, allowed it to cool under that strain, and then tested it. The maximum resistance of the material, as they called it, was about 15 or 16 per cent. above the resistance as they ordinarily find it, when tested in the usual way.

The facts elicited by this discussion were considered highly interesting and important, and a vote of thanks was extended to Professor Thurston for the information which he had conveyed to the Association. ' We have collated the above from the columns of the *National Car Builder*.

The Fireless Locomotive System.

Mr. Michael Flurscheim, a mechanical engineer of Gaggenau, Germany, indulges in the following speculations with regard to the possibilities of city and suburban traveling. He asks:

"Could not the principle of the fireless locomotive be applied to coaches, cabs and private vehicles? By calculation, I find that a tank of 1½ feet diameter and ¾ foot length, jacketed by a non-conductor of heat, would be sufficient to propel an ordinary vehicle, containing two persons, on a macadam or wooden pavement, at a speed equaling that attained by ordinary cabs. It seems to me that in cities like London, Paris, New York, Boston, and even in smaller towns, large charging boilers could be kept at each cab-stand or in each street, where, at a minute's notice, a charge of hot water could be obtained at a moderate expense, which would propel the vehicle, say seven miles, and then another charge of hot water could be obtained. Horses could thus be entirely done away with, and traveling would be cheaper, more convenient, and less dangerous. A man who now keeps a horse and carriage could, at less expense, purchase a little buggy provided with a fireless engine, and keep it at the boiler stand in his street. If he wants to drive, he sends his boy or man to the stand; in one minute the boiler is charged, and the cab at his door. He need not be afraid of keeping his horses waiting at his door, as no weather will injure his steam animal. If this system were generally adopted, the municipalities would probably be forced to lay narrow gauge tracks along each street, connecting with the cross streets by easy curves; and tracks for longer distances all over the country would follow, connecting with the city roads and provided with boiler stations. We could then easily come to town from our country places, or travel all over the country, in our own vehicles, at very little inconvenience, needing no one to look after or feed the horses."

This will do to talk about, but where will this mode of traveling be when we get steering apparatus for the balloon?

CONDENSATION IN STEAM CYLINDERS.—By the use of leap facings to pistons and cylinder lids, a considerable economy in the use of steam may be effected. An iron lid and piston will, other things being equal, condense more than three times as much steam as a lead-faced piston and lid. The thickness of metal heated and cooled at each stroke is not considerable, and not far into the metal a zone of constant temperature, lower than that of the steam, will be found. The distance from this zone to the inside of the cylinder will depend on the conducting power of the metal, and will be about 9 for lead to 12 for iron. It may be shown that, in any case, the thickness of the lead facing may be kept within very moderate limits. Other materials may be used for the same purpose, as for instance, tin, the specific heat of which is 0·562, its specific weight being less than that of iron. Its conducting power is, however, in excess of that of iron, being as 15 is to 12.—*The Engineer*.

Wire Rope for Transmission of Power.

The considerable introduction of wire ropes for the transmission of power, and for other purposes in the mechanical arts, makes it of importance to know the best methods of employing them, and the precautions necessary to be observed in their use. In this connection we call attention to the following remarks, which are excellently endorsed. For safe working load allow one-fifth to one-seventh of ultimate strength, according to speed and vibration. When substituting wire rope for hemp, it is good economy to allow for the former the same weight per foot run which experience has approved for the latter. Wire rope is as pliable as new hemp rope of the same strength; the former will, therefore, run over the same sized sheaves and pulleys which are used for the latter. But the greater the diameter of the sheaves, pulleys, or drums, the longer the wire rope will last. The size of the drum should be as follows: The same figure which expresses the circumference in inches of the ropes, is also the minimum. diameter of the drum in feet; doubling the figure will give the maximum. In the majority of cases the rope will wear twice as long on a drum of maximum diameter as on one of the minimum. Experience likewise teaches that the wear increases with the speed; it is better, therefore, to increase the load than the speed. Wire rope must not be coiled or uncoiled like hemp rope. When mounted on a reel, the latter should be turned on a spindle to pay off the rope; when in a coil, without reel, roll it over the ground like a wheel, and let the rope run off in that way. All untwisting must be avoided. To preserve wire rope, apply raw linseed oil, or mix the oil with equal parts of Spanish-brown and lamphlack. To preserve the rope under water, or under ground, take mineral or vegetable tar; add one bushel of fresh slacked lime to one barrel of tar, to neutralize the acid, and boil it well; then saturate the rope with the boiling tar. The grooves of cast-iron pulleys and sheaves should be fitted with well seasoned blocks of hard wood set on end, to be renewed when worn out. This wood will save the rope and increase adhesion. The small pulleys or rollers, which support the ropes on inclined planes, should be constructed on the same plan. When large sheaves run with great velocity the grooves must be lined either with leather set on end, or cork, or with India rubber.—*Exchange and Review*.

SCIENTIFIC PROGRESS.

VANILLA FROM PINE TREES.—M. Heffman has informed the French Academy that his two pupils, who discovered a mode of obtaining vanilla from the sap of pine trees have established a flourishing manufactory. They obtain a hundred francs worth of vanilla from a tree of moderate size. The wood is not injured by the extraction of the sap. This communication was the more interesting as cases of poisoning have lately occurred through the substitution of the wild for the tame vanilla.—*Ex*.

The substance above referred to by our contemporary is not the tame vanilla, but has been named *vanillin* by Prof. Hoffman, from its similarity to vanilla, for which it is a perfect substituta. It is obtained from that particular fluid of the conifera, which flows between the bark and the wood—known as "cambium." This discovery furnishes another very remarkable addition to the series of the popular and economic triumphs of modern chemistry in furnishing new materials for use in the arts and economies of life.

PHENOMENA OF SOUND.—Prof. Henry recently read a paper on abnormal phenomena of sound, to which we have already briefly allnded in a previous issue of the PRESS, but did not give the following remarkable cases mentioned by him on that occasion, in which sounds had failed to be heard at very short distances. The battle of Seven Pines, continuing for three hours, was not heard by Col. Johnson of the Confederate army, only three miles away. Neither the highest nor the lowest pitched sounds are heard furthest, but those which are intermediate. Sometimes the extension of sound is favored, sometimes obstructed, by an opposing wind. The most penetrating sound for fog-signals is called a siren, and is made by regularly interrupted jets of high-pressure steam, the sound being sent through a trumpet. This has been heard 25 miles. Fogs do not obstruct sound, although the sunshine cannot penetrate a fog a mile thick.

NEW METHOD OF FILTRATION. — Professor Chas. A. Seeley has invented a new method of filtration. At the bottom of an open glass tube, say an inch in diameter, he places a piece of filtering paper, and over this a piece of India muslin, which is secured around the tube by a rubber ring. The tube is filled with the liquid to be filtered, and is closed at the top with a rubber stopper through which runs a piece of rubber piping. The tube is connected with two bottles, so arranged that the water in the upper one flows down into the lower one, forcing out the air, which in turn runs through the rubber pipe, forcing out the liquid through the filtering material. The arrangement is exceedingly ingenious, and by this means a liquid may be filtered in one-fourth of the time which the operation takes by the old method.

DARWINIAN EXPERIMENTS.—The Doudee *Advertiser* says: It is not generally known that a series of elaborate experiments, intended to illustrate the law affecting the variation and selection of species have been going on under the direction of able and intelligent naturalists. These experiments were begun soon after the appearance of Mr. Darwin's great work, and their object is to discover the extent to which by persistent effort species may be varied, to what degree particular organs may be changed by a different circumstance and condition, and how far technic and rudimentary development may be increased and accelerated by special conditions and wants. Those experiments are carried out with the utmost care, and their results recorded with accuracy; and they will no doubt in due time throw much light on the doctrines of development and natural selection. The period during which they have been conducted has as yet been too brief to yield important results, and they may require more than half a century before their scientific value is ascertained. These experiments are under the direct supervision of nearly all the more eminent naturalists of the day, including Sir John Lubbock, Mr. Darwin, and Mr. Wallace; and they will be the first sustained scientific test to which the laws affecting the variation and origin of the species have been subjected

SCIENTIFIC WORK.—Not least among the advantages offered by science is the fact that scientific work must be honest work. The investigator finds that he must work according to the laws of nature or else fail utterly. During the last session of the Royal Institution, Mr. Francis Galton delivered a lecture "On Men of Science—their Nature and their Nurture," in which, after stating that the ratio of scientific men to the population of England is about one in ten thousand; he shows that the characteristics of those men are energy, health, steady pursuit of purpose, business habits, independence of character, and a strong innate taste for science. These qualities are strongly marked; hence, in addition to the laws of nature, we see a reason why scientific work should be honest work. But among them health stands conspicuous. Mr. Galton records two of the answers he received to his enquiries on this particular—"Only absent from professional duties two days in thirty years;" "only two headaches in my life;" and, "never ill for more than two or three days except with neuralgia," the latter being from a man between seventy and eighty years of age. "It is positively startling," says Mr. Galton, "to observe in these returns the strongly hereditary character of good and indifferent constitutions."

PREPARATION OF METHYLIC ETHER.—Methylic ether is coming into use somewhat in the manufacture of ice, especially by Prof. Linde's process. The following method for its preparation has been devised by Erlenmeyer and Kriechbaumer, of Munich: One and three-tenths parts of pure methylic alcohol are mixed with two parts of sulphuric acid, and heated in a flask with a return cooler, gradually, to 140° C. The gas given off steadily at 110° is passed through caustic soda to remove any sulphurous acid, and is then absorbed by sulphuric acid, which is surrounded by water to cool it. One volume of sulphuric acid will absorb 600 volumes of sulphuric ether. This solution, or, rather, compound, will keep indefinitely, and may be transported in acid carboys. When the ether is to be introduced into the ice machine, it is only necessary to drop one part, by weight of water, in order to liberate the gas regularly. On warming a little the acid gives up 92 per cent. of the gas dissolved in it. By this process, from 57 to 70 per cent. of the alcohol, by weight, is converted into ether.

IMITATION OF LACE OR SILK BY PHOTOGRAPHY.—A new and beautiful application of photography has lately appeared in England, by the aid of which any lace design can be transferred to silk, so that the latter material appears to be covered with the delicate and costly fabric. The lace to be copied is secured in a frame in contact with sensitive albumerized paper, and exposed to the light until a very deep impression is obtained. This is then fixed, and the paper washed and dried, forms a perfect negative. And the piece of paper is then sensitized with bicromate of potash and gelatin, and exposed under the negative. Inking with lithographic transfer ink follows, and the paper is placed in water and lightly sapped with a sponge. This throws out every detail of the inked spaces, the rest remaining white or free from ink. The impression is lastly transferred to a lithographic stone, and thence printed upon the silks by the usual process.

PHOTOGRAPHING THE COMET.—Schaarwechter, in Berlin, attempted to photograph the comet, visible about the first of July, but, in spite of half an hour's exposure, was unsuccessful. Lockyer, in England, made a similar experiment with a telescope which followed the motion of the comet. In two minutes he obtained a picture of the faintest star in the Great Bear, but could not obtain any image of the comet, even with an exposure of ten minutes.

ACID IN THE GASTRIC JUICE.—R. Maly finds that the pure gastric juice in dogs contains no lactic acid. The decomposition of chlorides by lactic acid cannot therefore be the source of the hydrochloric acid in the stomach. Lactic acid seems to play no part in the chemistry of or the normal formation of acids. The source of the free hydrochloric acid in the stomach is a process of dissociation of the chlorides without the action of an acid.

Mining Stocks.

The mining shars market hae besn for the past few weeks in a state of high excitement. Ths wondsrfnl developmsnts in the Comstock lode have had tbe very natnral effect of raising the stocks of moet of ths mines on that remarkable lsdgs to a price far above what even the owners expeoted. California, Virginia Consolidated and Ophir have been the favorites, but others have sleo sbared in the good fortune. If only half of what is promised in the way of dividende provs true, the mine owners ought to be abundantly eatiefied, as more wealth is coming out of ths old Comstock than even ite moet sanguine sdmirers sver expected.

The bonanza struck in the California and Virginia Cons. is richer than anything ever hefore fonnd in tbs lode, and even tbe ore body at the Belcher and Crown Point is thrown in the ehade. Speaking of this wonderful body of rich ore, the *Enterprise* of laet week esys:

The progrsss of the work of development is being closely watched, and thoss who are purchasing stocks are doing so on their judgment baeed npon their knowledge of the extent and valne of the developments thus far made. Thoss who diecredit the exietence of a great body of ore in the Virginia Consolidated, California and Ophir mines—a body of ore abeolutely immense, and beyond all comparison superior in every respect to anything ever before seen on the Comstock lode—ehow lack of wiedom and do but publish their own narrow-mindednees and prejudics. Never before in tbe history of mining operations in this State has more ample opportnnity been afforded all clasees—speculatore in stocks, millmen, mining experts, men of ecience and common citizens—to see and examine for themselves. Day after day men have come from San Francisco in order to assure themeelves in regard to the truth of what had been told them in regard to the almost incalculable value of the ore body opened upon them. Tbeee men have seen for themeelvee, have gone away satisfied and are the men who are now buying the stock in tbe mines. High as the present prices of the three mines in question may esem, these pricee are but in accordance with ths developments made snd making, and are paid by men who bslieve that it is worth the money. However, the fact is that the valne of tbe great bonanza is now generally acknowledged, and it would seem, from all accounts, tbat we who are here on the ground are taking the matter much more coolly than are our friends in San Francisco.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco.

WARN G. & M. Co., Dec. 17—Location: Storey Co., Nevada. Capital stock $4,000,000. Directors—Thos. Cole, E. M. Fry, M. D. Townsend, G. W. Fisher and Hill Beachy.

NORTH CALIFORNIA S. M. Co., Dec. 17—Location: Washoe. Capital stock $6,000,000. Directors—Thos. Cole, E. M. Fry, M. D. Townsend, G. W. Fisher and Hill Beachy.

TROY S. M. Co., Dec. 18. Location: Virginia District, Nevada. Capital stock $10,000,000. Directors—A. B. Perkins, E. C. Brown, John B. Spring, A. C. Taylor and H. S. Brown.

STAR QUICKSILVER M. Co., Dec. 18. Location: Sonoma county, Cal. Capital stock $500,000. Directors—Lewis B. Harris, Samuel Foster, G. Sanderson, James A. Brown and C. A. Eastman.

OPHIR G. M. Co., Dec. 18. Location: San Bernardino county. Capital stock $600,000. Directors—E. J. Baldwin, Samuel T. Curtis, James R. Keene, John W. Coleman and A. Goldsmith.

THE EAST BELCHER M. Co., Dec. 22.—Location: State of Nevada. The Capital stock is $10,000,000, divided into 105,000 shares. Directors—James Mee, Chas. J. Collins, Martin White, Geo. H. Mallard and John Spring, Jr

CALIFORNIA CONFEDERACY, Dec. 22,—Capital stock $50,000. Object: The importation of thoroughbred horses into the State of California, and the improvement of the breed of horses raised in the State. Directors—Geo. M. Pinney, Ezekiel Wilson, J. S. Taylor, A. E. Swain, John Martin, O. F. Willey and Wm. Shear.

MINERS' UNION.—On the 14th instant the semi-annual election of officers of the Gold Hill Miners' Union was held at their hall, at a regular meeting. The following officers were elected for the ensuing term: President, John K Connor; Vice-President, Maurice O'Connor; Recording Secretary, Daniel D. Donovan; Treasurer, Matthew Crowley; Conductor, Patrick Smith; Warden, Thos. Daly; Finance Committe, Wm. L. Force, John Wade and A. C Hey.

OCCIDENTAL MINE.—The Gold Hill *News* says that in this mine prospecting operations have been continued during the past yesr without intermiession on a scale of considerable magnitude. The main drift has been run in the ore veiu for a length of 3,000 feet. Winzee have been snnk from the top of the ore body and raised from the lower adit, which are now connected. These vertical openings have been carried throngh the ore without showing ite widtb. Crossdrifte have been started at regular intervale to develop the vein between the two levele, wbich are 300 feet apart. All the lateral drifte are now in thorough repair, and the whole mine is in complete working order.

ON THE Sierra Nevada mine, on the Cometock, the hoistiug and pumping machinery at the old sbaft ie being overhauled and put in good trim, in order to repair the shaft and resume einking. This ebaft ie 700 feet deep, and it ie propoeed to sink it 100 feet deeper, and drift for the valuable ore deposit recently developed by a drift nortb from the end of the old tunnel, and eome 300 feet from the shaft. At the same time an incline will be commenced from the bottom of the ebsft, to follow tbo dip or inclination of the ledge eastward. As soon as practicable new and powerful machinery will be erected at this shaft.

PANAMINT.—A gentleman from Pauamint, reports very cold weather there. The Jacobs mill had been running about an hour before he left. The new district, Wild Roee, some ten miles north of Panamint, wae caueing great excitement. There was also a rnsh to the new Coso mines. There are abont fifty honses in Panamint, and lumber is twenty-five cents per foot.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

CALAVERAS COUNTY.

UPPER COUNTY ITEMS.—Calaveras *Chronicle*, Dec. 19: Entsrprise mill is nearly completed. Teams will eoon begin to haul ore from the mine to the mill. Sbaft down 142 feet. Vein carries in lower level four feet of milling ore. Ore in eight, 3,000 tons. Some 50 tons of ore from Miller & Co.'e mine averaged $23 per ton. The hoisting works are now nn by a steam engine. Haskins & Co. crushed 33 tons of ore which prodnced $4.760 or $142.42 per ton. The chimney this ore was taken from ie increasing in length. Work has commencsd at the Josephine.

THE RED HILL CLAIM.—Preparations for re-opening tbe Red Hill claim go briskly on. About 3,000 of the 4,000 feet of iron pipe required to convey water to the mine are made, and the remainder will be finished as soon ae possible. A large quantity of pipe has been hauled to the claim, and ae soon ae it is tarred will be pnt in position. Everything will be in readiness for active operatione shortly.

NEW DISCOVERY.—Meesrs. Hnrbert & Gouldson recently made a rich discovery on the extension of what is known as the old French lead. At the depth of 20 feet, they found a foot vein proepecting $70 to $75 per ton, and tbe indicatione are ench as to justify the belief that they have fonnd a large and valuable chimney of ore.

HASKINS & CO.'s mine at West Point, Calaveras county, from 33 tone of unaseorted rock taken from the mine and crnebed at Carlton's mill, cleaned up $4,620, or an average of $140 per ton.

EL DORADO COUNTY.

SALE OF MINING GROUND.—Mountain *Democrat*, Dec. 19: McClelland, Phillips & Co. have recently sold to a San Francisqo company their mining claim known as the Dry Gulch claim, consisting of 160 acres of gravel, situated about three miles above Pleasant valley. The parties purchasing have also bought Davenport's ditch, which is about five miles in length and conveye a good head of water to the claim. The ground ie nnqueetionably first-class, and the new company will immediately put it in first-rate order for extenaive operation.

KERN COUNTY.

BIG BLUE.—*Courier*, Dec. 19: During the past few yeare the value of the rock has been thoroughly tested, and the vein determined to be as great ae surface appearance indicate, while the fact of its being a true fiesure ie placed beyond all cavil. These developments have decided the company to work it on a commensurate scale. With that view Mr. Burke hes been engaged for a year past in the creation of an immense mill—to run by water power—that will probably have a crushing capacity of 120 tons per day, and hoisting and pumping works of the most approved description. The pumping apparatns in particular is the most complete and powerful on this coast. There is enongh ore in sight, without further exploratione, to run the mill five years. In the nnmbsr of men it employe, directly and indirectly, the amount of farm produce it consumee, etc., it has been a source of considerable wealth to the county, although slight in compariecn to what it will be when operated on the grand scsle contemplated. Abont four months hence everything ie likely to be well under way. The mill may be ready to etart within three months. The Big Blue ie not of that clsss of leads usually styled rich, yet it belongs to a kind that always, under proper management, yield large fortunes to the owners. It will average uot far from 40 feet in thickness. Gold of a fine quality ie evenly diseeminated throughout the vein matter, which will probably, at the lowest estimate, taken from eide to side, yield an average of $15 per ton. This looke small, bnt when it is considered that $5 per ton ie an extravagant estimate of the coet of mining and milling, including intereet and wear and tear, the valne of the mine in view of ite vaet extent and practically exhaustless charecter, becomes apparent.

NAPA COUNTY.

MORE RICH DISCOVERIES.—Napa *Register*, Dec. 19: Yonntville and its vicinity hae been thrown into a tumultuous excitement by the discovery of very rich cinnabar indications in the hills on the west eide of that town. The etrike has been made on the property of Chas. Hopper.

PINE FLAT MINES.—Cor. *Reporter*: In the Geyser mine four tunnele have been run in, the mein one of whioh ie in 300 feet; the othere from 100 to 150 feet. Splendid ore ie being teken ont and it looke as if there was no end to it. The present force employed consiste of 30 white men and 50 Chinamen. The new furnace, Knox & Osborne, 15 tons capacity, is also finished and will be ready to start up about the 25th of this month. Mr. Roda is superintendent.

THE Miesouri mine has stopped running its retorts. A furnace will be put np in the spring.

THE Kentnck mine is also run on a small scale for thie winter. Only four miners are at work.

At the Annie Belcher mine the new furnace, a Knox & Osborne, 15 tons capacity, is finished

and drying beautifully, and by the 20th of this month will be ready for charging, by which time there will be 80 tons of ore on the dump for reduction. About 135 men are employed now, but a large force of Chinamen will be put on soon for making adobes.

The Sonoma mine tunnel is in 650 feet, and four other tunnels vary from 50 to 100 feet. Besides these six shafts have been sunk, and the mine is being thoroughly and systematically prospected. Here everything is being conducted on the most economical scale, every item is made to count, and I believe the lowest grade ore on the coast has been put through this furnace with a fair profit to its owners. The entire average cost of extraction and reduction in this mine is but $3 60 per ton, and certainly does more than credit to its management, which is in the hands of Mr. Clark, the superintendent. The furnace has stopped running for the winter, and there are about fifteen men working at present, but an additional force will be put on again in a few weeks.

PLACER COUNTY.

Booth Mine.—Placer *Herald* Dec. 19: Just now a force of men are engaged in erecting a whim for hoisting rock, as the old apparatus is no longer efficient. Over these hoisting works a large building is being erected, which will add much to the comfort and convenience of all hands, and especially those who work above ground. The developments of the mine would well justify even more extensive improvements. The shaft is now down below all surface water, and the rock is of the solid primitive formation. A blast the other day revealed a sight beautiful indeed to behold. A large piece of rock was thrown loose, of several hundred pounds weight, which was fairly flecked with free gold. This quality of rock at this depth and formation is something almost wonderful, and it is no wonder the old miners looked at it with astonishment, and the younger ones became much excited.

At the Julian mine a full force is employed in drifting and sloping. The 20 stamp mill is kept running night and day, on rock from this mine. The yield at the last clean-up exceeded the expectations of the owners.

At the Green mine the prospects are altogether encouraging. The present mill stands about 80 rods from the mine, and is run by water power. The company are talking of erecting a steam power mill, with increased capacity near the mine. This would be a fine improvement which we hope to see carried out.

The Crater mine is turning out very rich rock, and those who have an interest in that direction are feeling very fine.

Mining at Damascus.—Placer *Argus*, Dec. 19: The Mountain Gate company, one of the oldest mining companies in the county, is steadily pushing its work, with favorable results. Being engaged in tunnel mining, they do not require a large supply of water, and sufficient comes from the tunnel to supply all their wants and enable them to wash the year round. Their tunnel is now fully a mile into the mountain, still in good paying gravel, with fine prospects ahead. The claim has been worked for twenty years, and has paid well. Thirty men are now engaged on the claim, and there is no scarcity of pay. Lewis & Co.'s claim is already turning out well.

SIERRA COUNTY.

Good Pay.—*Mountain Messenger*. Dec. 19: A short time since the Bald Mountain finished washing up the small dump, the yield of gold dust being 2,400 ounces, from 8,000 car-loads of gravel. They have barely made a beginning on the large dump, which contains about 16,000 car-loads of gravel, which it is known will pay as much per load as the smaller. The company have just about water enough to keep up with the drifters, the recent north wind having diminished their supply considerably. They are now working ninety odd men and have room for about twenty more if the present supply of water keeps up. The quality of gold taken out is what is denominated as "coarse," the largest piece yet found weighing 65 oz. The pay channel varies from 500 to 800 feet in width, the gravel being about four feet in depth. The superintendent, H. Wallis, as good a gravel miner as there is in the State, informs us that in his experience of twenty years he has never seen a channel that paid so uniformly and so well as this. The further into the mountain they go the richer becomes the gravel, and this year's dividend will probably reach $10,000 to the share or $200,000 in the aggregate. The company has acres of rich ground prospected but not worked—ground enough to last for years without driving a tunnel another foot ahead.

The South Fork company, of Forest City, have just closed a contract for running 300 feet of bedrock tunnel. This tunnel is in something like 3,000 feet, but not to the point where the owners expect to strike a pay channel, under the ridge between Forest City and Alleghany, but to the eastward.

The North Bloomfield company, at Forest City, are now in 2,700 feet with their tunnel, and are still driving ahead for a pay channel under the cement ridge west of town.

TUOLUMNE COUNTY.

The Riverside—*Union Democrat*, Dec. 19: This week we saw a solid bar of gold weighing over twelve pounds, the result of seven and a half days crushing at the Riverside claim. The owners are now running a ten-stamp mill, and are adding ten more stamps. By the first of January it is expected to have twenty stamps in operation. This mine, the old Telegraph, is another evidence of good mines being laid aside when failing to pay a profit. A number of years ago it was very profitable, then ceased paying, and for a number of years laid idle. The present owners went to work and opened it as it should be, and are now reaping the result of their energy and labor.

Street Mining Stopped.—Tuolumne *Independent*, Dec. 19: The mining operation commenced on Holden street, near the creek, by Mr. J. T. McLean, has been abandoned in its infancy; a demonstration of a number of citizens against it, and Mr. not desiring to harrow up their souls and create bad blood, desisted like a sensible man.

The Golden Gate company talk of erecting chlorination works on their mine, to work their sulphurets at home instead of sending them abroad.

Mill Moved.—The five-stamp mill lately engaged in chewing up rock on the Fidelity lead, at Five Mile creek, will be removed to the Ohio at Calder's ranch.

Nevada.

WASHOE DISTRICT.

Con. Virginia.—Gold Hill *News*, Dec. 17: Daily yield about 300 tons. The winze sinking in the ore body, below the 1550-foot level, has attained a depth of 70 feet below that level, and is in good ore at the bottom. On the 1550-foot level the exploring drifts are all in excellent ore. The character of the ore on this level and in the winze beneath it is of great hardness and solidity. On the 1500-foot level the east cross-cut No. 1, is 230 feet in length, and cross-cut No. 1, near the northern boundary line, is extended. Both of these drifts have passed through ores of extreme richness, and still show the same description in their present faces. The drifts in the course of extension northerly and southerly between the cross-drifts are driven through first-class ore.

Sierra Nevada.—Daily yield about 60 tons of ore, principally from the old upper workings. The pumping machinery at the new shaft has worked well the last few days, and the water is nearly all out. Sinking will be resumed next week. The old ore breasts of the mine continue looking and holding out well.

Gould & Curry.—On the 1700-foot level work has been resumed. On the 1500-foot level the water from the east vein continues to flow with unabated force and volume. The winze progressing below this level has been sunk to a depth of 220 feet. This winze is passing downward through favorable vein material and will soon unite with the north drift on the 1700-foot level. The accomplishment of this connection will secure sufficient ventilation to allow of the vigorous explorations of the ore body on this level at all points.

Belcher.—Daily yield, 450 tons, from the old working levels. The ore breasts are yielding as usual and show improvement from last week. The prospecting of the 1500-foot level is being actively carried forward by means of winzes from the 1400-foot level, which are being sunk in the ore vein, with no heavy developments thus far. The station at the 1500-foot level is well opened.

Kossuth.—The new shaft is down 335 feet and progressing downward two feet per day. When the shaft shall have attained a depth of 350 feet, it is proposed to open a station and drift for the ledge. The shaft will be continued downward at the same time, to the 500-foot level.

Lady Washington.—New shaft down 240 feet to-day, and at the depth of 60 feet further the first station will be opened, and a drift east for the ledge will be started.

Nevada.—The main ore chimney, in the upper workings, is yielding a goodly amount of excellent ore at the present time. The lower tunnel is running in ledge matter, but has not yet reached the ore chimney. The ledge is very wide.

Ophir.—Daily yield, 245 tons, principally from the 1300, 1400 and 1465-foot levels, car samples of which run from $75 to $115 per ton. The ore bressts in the floors between these two levels, continue looking and yielding splendidly and the cross-cuts of the 1465-foot level are all in fine ore. The cross-cut from the winze, 35 feet below the 1465-foot level, near the California line, is in very rich ore indeed, assaying high up in the thousands.

Imperial-Empire.—Main drift north at the 1850-foot level still pushing ahead toward the Yellow Jacket line. The south winze ran nearly out of ore a day or two since, but is now in good ore again. Progress is very slow at the 2000-foot level, owing to the very hard rock encountered, as also to every blast throwing out hot water. Quit a stream of this was struck last week, but has subsided materially.

Utah.—Preparing to place the new pumping engine in position. The pump now in use is one of the largest on the lead, and is in perfect order. New wire cables have been received and are now in place. Sinking the shaft will be resumed for the 600-foot level, as soon as the engine is erected. The prospecting of the 400-foot level is meanwhile vigorously prosecuted.

Hale & Norcross.—Down on the lowest level, 2100 feet from the surface, the cross-cut drift west is advanced a distance of 120 feet, and has penetrated the ore vein. At this point no concentrated body of paying ore has yet been penetrated, the character of the material exposed being regular vein matter of fine appearance.

California.—On the 1500-foot level the east cross-cut in progress 200 feet north of the south line of the mine, is extended 43 feet, and is now traversing a belt of hard rock precisely similar in character to the stratum passed through in the east cross-drift near the southern boundary. On the 1400-foot level the cross-drift running east near the center of the mine, is already advanced 110 feet. The material exposed by this drift as it progresses eastward is of a promising appearance.

Leo.—The face of the main tunnel shows considerable improvement since last report. The ledge matter is much softer and steadily improving in quality as further advance is made. The face of the north drift continues in very favorable vein matter.

Original Gold Hill.—At the 340-foot level, from the switch where the main west drift branches, 70 feet from the shaft, a drift southwest is being run. A northwest drift is also being run.

Dayton.—Daily yield, 65 tons. A heavy body of water has been tapped in the north drift of the second level, giving a 10-inch flow of water, but this has abated considerably. The south drift is yielding some excellent pay ore, and improves as further developed.

Chollar-Potosi.—Resumed drifting at the 1100-foot level last night. The ore-producing sections show improvement in quality, and the usual amount is being extracted and shipped to the mills.

Mexican.—The active development of this newly consolidated mine will be carried forward at once through the Ophir mine, of which it was recently the north half. A cross-cut east is commenced, from the main north drift of the 1645 foot level from the Ophir, at a very favorable point to find out what is in the Mexican ground.

Julia.—The prospecting developments at the 1000-foot level and other parts of the mine are going ahead, with excellent promise.

Crown Point.—Daily ore yield 500 tons, from the old working levels. The prospecting and opening out of the 1500 and 1600-foot levels is being actively carried ahead as usual, and good developments are confidently expected. The east ledge at the 1500-foot level shows improvement.

Bullion.—The south drift at the 800-foot level gives good assays from occasional bunches of quartz met with, and good hopes of getting an ore body at that point are reasonably indulged in.

Senator.—The indications are favorable for finding a larger body of pay ore than what is developed already. The assays from drift No. 1 run up to $40.

Woonville.—The ore breasts of the 200 and 300-foot levels continue to yield enough ore to keep the mill steadily running. The winze below the 300-foot level is in good ore. The new hoisting works just completed, started into operation yesterday, working finely.

Yellow Jacket.—The drifts both north and east, at the 1740-foot level, are being actively carried ahead, and the main incline is down 109 feet below that level to-day.

Globe Consolidated.—Main west drift going ahead at a satisfactory rate, the face in gravelly quartz and soft ledge matter, with a considerable influx of water. The winze below the north drift at this level continues in very favorable looking vein formation.

Rock Island.—The winze in the east vein continues its showing of fine looking quartz.

Baltimore.—The face of the drift at the 750-foot level shows considerable improvement.

Phil. Sheridan.—A slight increase of water is perceptible, and the indications strongly favor a near proximity to the ledge.

American Flat.—At the 750-foot level the ore indications in the face of the drift have much improved during the last few days. The prospects in the winze at the 450-foot level have also improved considerably.

Silver Hill.—The northeast drift at the third level continues to show improvement, and the quartz in the northwest drift gives higher assays.

Colorado.

San Juan.—*Prospector*, Dec. 12: Professor N. A. Foss and Colonel L. P. Dodge, both connected with Messrs. Greene & Son's smelter, in Baker's park called at the *Prospector* office to-day as we were going to press, and allowed us to gaze upon the first silver brick from the San Juan country. It weighs about 40 pounds, is 98 fine, and coin value $800. The brick will be sent to Judge Greene, at Cedar Rapids, Iowa.

Leasing.—Georgetown *Miner*, Dec. 12: The work of leasing mines has been more active during the past few weeks than ever before. The discoveries on Democrat in part account for this, but the work is not by any means confined to that locality. Mines in different districts and on all the mountains are being prepared for active operations during the winter.

Big Mill Runs.—P. McNulty & Co., working on the Rogers, have recently had mill runs made at the Stewart reduction works, of ore from their shaft, which is now down about 100 feet from the surface with the following results: 1,227 ounces silver per ton; 1,700 ounces; 1,750 ounces; and 2,140 ounces. These are not specimen assays, be it remembered, but actual mill runs.

Raw Amalgamations.—For some time past, Dr. George C. Munson has been experimenting with a class of silver ores found in this district running high in the precious metal, by a process of raw amalgamation, that is, without subjecting the ores to the roasting process. He has succeeded in getting from Polar Star ore, the satisfactory result of 92 and 52-1,000 per-cent. of the actual assay value.

Reduction Works.—Last week we alluded to the proposed erection of furnaces in Peru district next season. These furnaces will be similar to those now being so successfully operated by Spears & Consnt, near Breckenridge. They will be put up by T. C. Johns, who intends to commence work upon them at the very earliest practicable moment next spring.

Idaho.

Placer Mining—Silver City *Avalanche*, Dec. 12; Dr. Newsom is enjoying a vacation from office work by opening up a set of placer claims on a flat near the road leading across the mountain from the Golden Chariot Mill to the Half-way house. He has well nigh completed the blasting out of the tail race, and informs us that he gets a very good prospect, and thinks his ground will pay handsomely when the water starts in the spring.

Elias Brown how gone up to Banner district, in Boise county, where he has valuable quartz ledges, and will work until the middle of January, when he will return and go East with the view of selling some of his ledges.

Montana.

Mining at Philipsburg—*New Northwest*, Dec. 11; Mr. B. P. Tilden, manager of the Hope mining company, informs us everything is progressing favorably at Philadelphia, and property owners in a good frame of mind. The Hope company's new shaft on the Hope lead is down 50 feet. About 30 tons of ore which it is estimated will yield $200 by milling process, has been taken from the shaft which averages about two feet crevice. Besides this they have 70 tons of ore graded to $50 by milling process. As this process only saves about 60 or 70 per cent. where 90 per cent. can be saved by the roasting process, it shows a valuable class of ore is being mined.

Mining Affairs at Butte.—Mr. Frank Ramsdell handed us this week a large sample of the ore now being taken from the 125 foot shaft on the Parrott lead at Butte which is rated at nearly $1,000 to the ton. Considerable work is now being done on it and will be this winter. Messrs. Talbott & Downs have a 50 foot shaft on discovery, and four or six men will be employed this winter sinking on that and taking down the ores through to No. 2. The quality and quantity of rock is about the same as at like depth on the one-half shaft, rating from $150 to $200. The First National bank of Helena is contracting these ores on the dump and they pay a good profit. The Parrott is steadily rising in estimation as a true, rich lead. Considerable other work and representation is also being done in the camp. The ores in the camp smelt readily, and as much useless transportation can be saved by reducing the ores to metals, it is in contemplation by Messrs. Talbott and Wolverton to put a furnace in operation for that purpose if satisfactory arrangements can be made with property owners. Ores were smelted with very satisfactory results some two or three years ago, but through personal disagreements and legal complications the business was suspended and essential machinery sold to parties for use elsewhere. It is to be hoped it will be revived.

Silver Lake District.—This new district is near cable, on the Silver Moss. They have fitted up a sampling room, have sunk a couple of shafts ten feet each on the Fairview and put up a shaft house and will continue operations on that and the Silver Moss this winter. There is considerable snow over the entire district. Con Bray and partners, and Meacham & Venable have all gone out, but there is much interest and confidence in the district and it will be thoroughly prospected in the spring. The ores found are very rich.

Utah.

Stockton Mines.—Cor. Salt Lake *Tribune*, Dec. 15: The Great Basin mine is working a number of men in the incline and surface cut, the former of which is now down forty feet from the tunnel, showing about three feet of galena and carbonate ore, and showing well-defined foot-hanging walls. The First National mine is now down 180 feet in the incline, showing pockets of high grade ore, the character of which is mostly solid galena, running very high in lead and silver. The Leonore mine still continues to improve, and is daily raising about five tons of high grade galena ore. The new house has just been completed, and will greatly facilitate the shipments. Quite an extensive body of galena has been found in the deepest works of the mine. The Viola mine is being worked by its owners with good success. The incline is now in 33 feet and is showing a vein of about three feet of galena and carbonate ore. The Chicago smelter is now making a clean up run and will close down on the 20th, for the purpose of refitting, after which it will continue running all winter on ores from Dry Cañon and the neighboring mining camps. A new brick building has just been completed, to be used as the assay office of the smelter.

Park City Notes.—The Marsac mill, heretofore known and frequently noticed as the Flagstaff, is owned by a Michigan company, who also own the Flagstaff mine. The mill has 20 stamps, ten horn pans and five settlers; the whole run with a Corliss engine, of a 150 horse-power, capable of running 40 stamps with the requisite pans. The engine is acknowledged to be one of the finest pieces of workmanship on the coast. Every piece of machinery was put in motion on Tuesday last, (not excluding the whistle) and after a run of six hours, was pronounced a perfect success in every particular. The mill has a capacity of sixty tons of ore daily. There are about 300 tons already in the mill for a starter, and 1000 tons on the dump, now being delivered daily.

Mushroom Culture

In Robinson'e interesting work, "The Parks, Promenadee and Gardens of Paris," a chapter is given to the cultivation of mushrooms. A portion of thie chapter ie devoted to a description of underground mushroom culture ee it is carried on in the environs of Paris. The writer visited these "muehroom 'caves," some of which contain six or seven miles of mushroom beds, and gives us a carefully prepared account of their construction, mode of cul ure, productiveness, etc., accompanied with suitsble illustrstions; hut as this system—though poesessiug great practical value under the circumstancee under which they sre worked—would be impracticable in California, st the present time at least, we have not thought it worth while to reproduce it in the columns of the PRESS, and will pass on to the portion devoted to "Muehroom Culture in Cellars and in tbe Open Air."

The information to be found here can be msde available in varioue circumstances existing in this country. In order to make the method still more practicable we have hed tbe accompanying engraving executed hy our own artist. The author of the work referred to speaks of the cellsr and open-air process as follows:

Culture in Cellars and in the Open Air.

Of conrse they are only profeseional mushroom growers that carry on such extensive operations as those just described, hut the mushroom is slso grown extensively in cellars and like places. As an analogous mode of culture is more likely to meet the general wants, the following observations on the subject may prove acceptable. They are by M. Laizier, tbe president of the Mutual Aid Society formed among the Paris market gardeners.

"The manure to be nsed for this method of cnltivation should be prepared in the same wsy as that for the open-air system described further on. Preference should he given to a cellar producing ssline efflorescence; it should be as dark as poesible, and expoeed to no draughts. The warmth generated by the fermentation of the manure will subeide, and the sowing of the spawn must not be commeuced until the temperature of the bed has fallen below 76 degs. Fahr.; if it is above this the layers of spawn are liable to be burnt. Bede can be msde in cellars in many ways. Those made iu the middle should alwsys be formed with two sides, while those againet the walls should only be half as thick, on account of their having only one usefnl side. It is also possible to arrange them on shelves, one above tbe other. For this purpose strong hars of iron are driven into the walls, upon which are placed shelves of the propsr sized covered witb earth, upon which is formed a hed, that is treated exactly as those made upon the ground. These beds are just as productive as any of the other kinds. They may even be made on the bottoms of cssks, which should be at least two feet six in diameter; and they are built up in the shape of a sugarloaf, about three feet in hight, and the pieces of spawn are placed an inch and a quarter deep, and sixteen inches apart. A barrel is sawn crossoways into two piecee, each forming a tub. Holes are made in the bottom of eech, and a thin layer of good eoil is spread over them inside. They ere then filled with good well prepared stahle manure, just like thst used in the caee of ordinary mushroom beds, the different layere of dung in each tub being well preesed down. When the tub is half full, six or seven good pieces of spawn are placed on the surface, and the remainder ie piled up with msnure, which is well pressed down, the operation being completed hy giving to the heap the form of a dome. The tnbs thus prepared are placed in a perfectly dark part of a cellar, and eight or ten days afterwards the dung is taken up nntil the spawn is visible, in order to see whether it has commenced to vegetate and develope little filaments. If the spawn has struck, the surface muet be covered with soil, care being taken to nse only that which is fresb and properly prepared. The necessity of procuring good mushroom spawn cannot be too strongly insisted upon, thie being the indispeneable coudition for arriviug at a good result. An excellent kind is sometimes met with that has been formed spontaneously in some old dungheap, which is called virgin spawn. When this canuot be procured, excellent spawn may be formed in the following manner:—A little bed of stable manure is prepared, either in a cellar or in the opeu air, and sown with good ordinary mushroom spawn, the proper amount of care already deecribed being bestowed upon it. As soon as the mnshrooms appear on the surface of the bed the spawn remaining must be speedily removed and placed in a dry, airy situation. The spswn thus prepsred csn he preserved for two or three or even four yesrs. Specimens have been kept as long as fourteen years, from which excellent results have been o'tained."

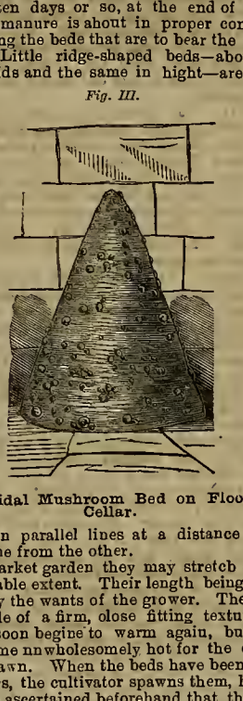
We will next turn to the culture of the mushroom in tbe open air. In old times the market gardeners of Paris used to grow the mnshroom amongst tbeir ordinary crops with great profit but since the Champignonnistes cultivate it nnder no danger from cold in the caves, the market gardeners, who used to raise it to a great extent in the open air, do so now in a lesser degree. They begin with tbe preparation of the msnure, snd collect that of the horee for a month or six weeks before they meke the beds; this they prensre in some firm spot of the market gerden, and take from it sll ruhbish, particles of wood, and miscellaneous matters; for, ssy they, the spawn is not fond of these hodies. After sorting it thue, they place it in beds two feet thick, or a little more, pressing it with the fork. When this is doue the mass or bed is well stamped, then thoroughly watered, and

Fig. I. *Fig. II.*

Newly Made Mushroom Beds.

finally again pressed down by stamping. It ie left in this state for eight or ten days, by which time it has begun to ferment, after which the bed ought to be well turned over and re-made on the ssme place, csre being taken to place the manure that was nesr the sides of the first-made bed towards the oenter in the turning and re-making. The mass ie now left for another ten days or so, at the end of which time the manure is about in proper condition for making the bede that are to bear the mushrooms. Little ridge-shaped beds—about 26 inches wide and the same in hight—are then

Fig. III.

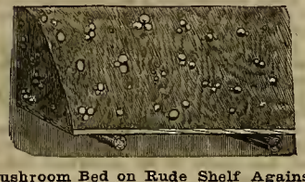


Pyramidal Mushroom Bed on Floor of Cellar.

formed in parallel lines at a distance of 20 inches one from the other.

In a market garden they may stretch over a considerable extent. Their length being determined by the wants of the grower. The beds once made of a firm, olose fitting texture, the manure soon begins to warm again, but does not become nnwholesomely hot for the spread of the spawn. When the beds have been made some days, the cultivator spawns them, having of course ascertained beforehand that the heat is genial and suitable. Generally the spawn is inserted within a few inches of the base, and at

Fig. IV.



Mushroom Bed on Rude Shelf Against Wall of Cellar.

about thirteen inches apart in the line. Some cultivators insert two lines, the second about seven inches above the first. In doing so, it would of course he well to make the holes for the spawn in an alternate manner. The spawn is inserted in flakes about the size of three fingers, and then the manure is closed in over, and pressed firmly around it. This done, the beds are covered with about six inches of clean litter. Ten or twelve days afterwards the growers visit the bede, to see if the spawn has

Fig. V.

Mushrooms Grown in Bottom of Old Cask.

taken well. When they see the white filaments spreading in the hed they know that the spawn has taken; if not, they take away the spawn they suppose to be bad and replace it with better. But, using good spawn, and being practiced hands at the work, they rarely fail in this particular; and when the spawn is seen spreading well through the bed, then, and not before, they cover the heds with freeh sweet soil to the depth of ahont an inch or so. For cover, the little pathway hetween the bede is simply loosened up, and the rich soil of the market garden applied equally, firmly, and smoothly with a ehovel. With these open-air bede they succeed in getting mushroome in winter. A covering of abundance of litter is put on immedistely after the heds are earthed, and kept there as a protection. They have not long to wsit till the beds are in full bearing, and when they are in that state it is thought better to examine snd gether from the hede every second dsy, or even every day where there are many bede. And thus they grow excellent mushrooms, snd in great quantity, all the further attention required being to renew the covering when it gets rotten, and an occasional watering in a very dry seaeon.

Beautiful Horticultural Importations.

The horticultural missionsries, who manifest their zeal in the good csuse, by entreating the heathens of Californiа to plant trees, should be informed thst tree-planting in this, as in most other parts of the United Stetes, has been almost a msnia for the last ten years. Consequently all such appeals are like sending flannel sbirts to the babies of Africa.

No stimulne is needed in this matter, and if any advice is to be offered for directing this tree-planting movement, it must come from the highest and best iuformed sonrces to be of any avail; for it is evident that a high degree of taste and practical judgment are, and have been employed in this great work.

In California, especially, the progresciveneee indicated in this directiou is remarkable. From information derived from our exchanges, and from inquiriee and facte communicated hy correspondents, we are impreesed with the conviction, that not only are treee being planted in abundance, but that there is a sufficiency of taste and judgment employed in the matter. The State University is keeping pace with the popnlsr taste in this direction, and is doing mnch to add to the wealth of California in its timber, fruit and ornamental possessions, and capitalists are manifesting a commendable interest in this subject, and are epending their money in thus improving the property owned by them; while people of more limited means are steadily improving and beautifying their poeeeesions in cities and villsges as well as in the country.

The recent importations referred to are twenty-four varieties of msple from Japan, which we had the satiefaction of examining at the establishment of R. J. Trumhull in thie city. The trees were accompanied with beautifully colored plates descriptive of the foliage of all the varieties. Theee plates were executed by the Japanese, the coloring as well as other parte being done by hand. A leaf of every one of the 24 varieties is given, its form and color heing represented in all their minutia. The varietioe of foliage dieplayed here is remarkable, many of the leaves being extremely unique in form and color.

The importation coneists of six trees of each variety; all grafts and all in excellent condition for planting. They were sent here to a gentleman who recently visited Japan, and observing these trees in full foliage there, resolved to try them in California. A large portion of them were engaged before the box was open, and on learning the names of the parties who obtained them, we were setisfied that they had fallen into good hande. The growth of this interesting family of maples will be watched with a good deal of iuterest by horticulturiets generally, ss well as by those who were fortunate enough to procure them.

CURIOUS TREES.—Just heyond the Darbonne or Calcasieu river, in the parish of Calcasieu, is a white-osk tree, abont two and a half feet in diameter. There are no branches for 25 or 30 feet up. About 12 or 15 feet up, a pine limb or top part of a pine tree, six or eight inches in diameter, and 12 or 16 feet long, runs at right angles through the center of the tree, sticking out abont the same distance on either side. It tapers a little to one end, where there are two or three knots, giving it the appearance of a tree top. The oak, where it passes through, is grown closely aronnd it. The pine is rich in turpentine and will not decay. There ie no fork or hollow in the oak; but it has the appearance as if a hole had been made and the pine stuck through, after which the osk closed on it by growth. The question is, how did the pine get through the osk, or the oak round the pine? In Mallet woode there is another white oak, of considerable size, that divides into two prongs about one a half feet from the ground, which after running up like a pair of bowlegs, about fifteen feet, unite in one round compact stem. The prongs are about one and a half feet in diameter; and where they unite above, the tree is larger than either of them, but smaller than both together. A man can walk between the two prongs, and the tree stands on a land boundary line. Forked treee are very common; but the question here is, how did the two prongs nnite so perfectly into one stem above?—*Opelousas, La., Journal.*

IN MEMORIAM.—A marble slab has been placed upon the house in which Agassiz was born, at Motier, Switzerland, with this inscription: "J. Louis Agassiz, the celebrated naturalist, was born in this house May 28, 1807."

California Not Considered.

The second annual report of the New York Produce Exchange is criticised rather sharply by the *Railroad Gazette*, on account of lack of uniformity in terms and estimatee used in constructing its tablee. The *Gazette* expresses its dissatisfaction as follows: "For instance, there are statistics of grain for different places and countries, which give quantities in one table in bushels, in others in English "quarters" (480 pounds) in others in English hundreds (112 pounds), in others still in Russian "tschetwerts" (ahout six hushels). We should doubtless have the California wbeat trade given in centals of 100 lbs., but for the astounding fact that no account whatever is given of thie traffic, though California already exports nearly as much as Russia, (to which several pages of statietics are devoted), and is very likely much of the time to export more than all the rest of the United Stetes, and is really the most formidable competitor of the country which exports through the Atlantic ports, with the single exception of Russia and is sure to remain so, as nearly its whole product must he exported for want of home market."

The fact is rather "astonishing;" and to attempt to account for it on the score of imputed jealousy would simply prove that the imputation itself was founded on jealousy. It is simply another instance of the fallihility of figures. The ordinary statistician, like a hedgehog, displays his bristling figures, evidently thinking himself invulnerable; which is really the case in too many instances; the lack of interest which characterizes a large portion of the enbjects which bring forth these bristling tables, rendering them entirely safe from critical attacks. The fact that this blunder on the part of the compilers of the report referred to is properly criticised by such authority as the *Railroad Gazette*, should thoroughly reconcile us to the seeming slight in failing to notice the wheat exports of California. We shall probably continue to grow and export wheat even though no estimate of our operation should ever he admitted within the tables of the statisticians.

Winter Irrigation and Drainage.

In our California winters we have to look two ways for danger. In some portions of the State we are fearful of too much rain. In such places let each farmer see if a portion of his land cannot be drained to advantage in winter. Cannot several landholders in a neighborhood work jointly to advantage in draiuing their lands? Is there not an opportunity to make ditches or embankments to carry the water shed around your lands? We are living in new fields here. We have not had a long line of ancestore to plan all the improvements possible on our lande, and hand them down to us carefully improved. Nature has done much for us in the lay of our lands, but cannot we often gain much by a little assistance in completing some of her simple plans?

Then in some sections we may not receive rain enough. Let us look about such lands, and see if a little labor will not enable ue to economize water streams now running to waste, by bringing their contents onto the land at a proper period during the winter or spring. Perhaps reeervoirs can he built, or a dem stretched across the lower end of your field to produce an overflow, which will secure you good crops in a dry season.

A NEW white alloy has recently been produced by M. Dalslot, which is said to be very cheap, and to possees qualities rendering it suitable to replace the various white alloys now in use. The proportions are pure red copper 80 parts, oxide of manganese, two parts, zinc, 18 parts, and phosphate of lime, one part. The copper is first melted and the manganese added little by little. When the latter is dissolved, the phosphate is similarly mingled. The scoria is removed and finally the zinc is added about ten minutes before ossting. To accelerate the fusion of the manganese, one-half part fluoride of calcinm, one-half part borax, and one part wood charcoal may be used as a flux.

IMITATION OF MARBLE THAT CAN BE POLISHED.—Corvin, of Dresden, manufactures an elegant imitation of marble for architectnral purposes, by impregnating sandstone with silicic acid and alumina. In Nanndorf, euch stones are prepared which are intensely white, transparent and capable of taking a polish. By the introduction of suitable pigments in the impregnating mass sny desired color is produced. The details of the process have not yet reached ne, but it is stated that the cost is much less than real marble, while it resists heat better.

NARROW GAUGE.—Utah has five narrow-gauge railroads, four of which are in operation, and the fifth will he onen on the first of November. Salt Lake City is now the greatest narrow-gange railroad center in the world.

NEW BRIDGE.—The new bridge across the Mokelumne river at Cherokee, about one mile from Lodi, is nearly completed.

Good Health.

Effects Of Imagination.

At a late meeting of the Paris Académie des Sciences a letter was read from M. Volpicelli, of Rome, to M. Chevreal, in which the writer related that, if a magnet were brought near a nervous patient magnetism had the effect of disturbing him in various ways, and notably in his condition of health. M. Volpicelli goes on to state that being invited to experiment on a nervous subject, at the San Spirito hospital, he practiced a little rose, and instead of taking with him a magnet provided himself with a piece of unmagnetised iron. The patient scarcely saw the piece of iron before he fell into convulsions; his imagination became so highly excited that nervous disturbances of the most extreme character supervened. M. Volpicelli then made a second experiment. A magnet was placed in the hands of another person suffering from nervous disorder, who, when a few minutes had elapsed was so extremely excited that it was necessary to take the magnet from him. M. Volpicilli, however, was convinced that the nervous disturbance was brought on by the sight of the magnet and not by magnetic action, and he was subsequently able to assure himself of the fact. The same person had to preside over a scientific meeting, and M. Volpicelli contrived to surround him with very powerful magnets, which were introduced into his chair, into the drawer of the table before him, and even under his feet, without his having the slightest suspicion of the trap laid for him. During the meeting, which lasted more that two hours, his nerves were not in the least affected; and when the meeting was over he declared, in answer to a question put to him by M. Volpicelli, that he was perfectly well; but when it came to his knowledge that he had been surrounded by powerful magnets he was extremely surprised and alarmed, and began to have the idea that he could not have been so well as he thought.

Let Blisters Alone.

One of the most generally diffused erroneous notions is that it is good and beneficial to break a blister, whether it is caused by a burn or the heating of a part of the body by continued friction under pressure, to which the feet especially are exposed after long walks in ill fitting shoes or boots. Such blisters are always found filled with a clear liquid, which must be retained and not drawn off by lancing them; and also those blisters often caused by a part of the skin being forcibly pinched and squeezed, and which contains blood, must be left alone. This water or blood in blisters is a healing substance, of a kind most appropriate for the parts where the skin is destroyed, and if the blister is allowed to dry out by itself, the new skin forms much more rapidly under it, and much pain is avoided. If the blister contains blood, it must be treated in the same way, as blood is the best healing salve. And, by the way, while using the word "healing salve," it may be well to state that there are no healing salves or healing plasters. All salves and plasters retard healing, and many wounds which heal notwithstanding the salves and plasters applied, would heal in half the time if left alone.

It is only in exceptional cases that a blister may be punctured, namely, when very full of fluid so as to cause much pain by its tension, a prick of a fine needle may be given so as to allow the excess of fluid a chance of escape. Instead of breaking a blister and destroying the loose skin over it, it should be protected so as to guard against any such destruction by accident.

BURNING AT A WHITE HEAT PAINLESS.—Dr. J. S. Camden publishes in the *Medical Times and Gazette* information very important to surgeons who are not cognizant of the fact, that the application of a white-hot iron to the body is absolutely painless, while when only red-hot it is an extremely painful operation. When operating with a red-hot iron on men the screeching was fearful, while when the iron was white-hot not a murmur was heard; and when he operated so on a horse the animal appeared to be scarcely aware of what was being done. He proposes to use for actual cautery a large spirit blow-pipe, but we can hardly think that this would do, as only in the center of the flame great heat is generated, while all around lesser degrees prevail, which would certainly be painful. We would recommend the more extensive use of the platinum wire, kept white-hot by the current of an electric battery; this has thus far been less used than it deserves. It may be too troublesome for private practice, but should be resorted to in all public medical institutions.

LIME VAPOR IN MEMBRANOUS CROUP.—Dr. John Bartlett, in the Chicago *Medical Examiner*, recommends the following method of using lime vapor: The patient is placed in a tent extemporized with bedclothes and clotheshorse. In this is placed a tub and in the tub a bucket filled with hot water. Patient being seated in the tent with nurse, unslacked lime is dropped into the water. From time to time the physician estimates the state of the vapor, increasing the steam and lime by dropping into the water pieces of lime. The quantity of lime required is large. The doctor's experience in the use of this bath has been a happy one. The onward march of the disease seemed checked at once and a real improvement to take place.

Treatment of Felons.

We recently gave the following item under this head from the London *Lancet*: "As soon as the disease is felt, put directly over the spot a fly blister, about the size of your thumb nail and let it remain for six hours, at the expiration of which time, directly under the surface of the blister, may be seen the felon, which can instantly be taken out with the point of a needle or a lancet."

We now reproduce it in order to give the following remarks upon this item by a medical correspondent in Vineland, N. J.:

"I have noticed the *Lancet's* cure for bone felon several times in the current medical journals during the past three years, and I think the notice too brief to be understood.

"I have employed this treatment for the past seven years and with results that lead me to adopt it altogether. A piece of adhesive plaster, an inch or more in width, and long enough to go once and a half around the finger, should have spread upon it a surface of cantharidal plaster, the size of a three cent piece.

"This surface should be applied to the tender part and the adhesive plaster carried around the finger and lapped.

"It should remain for twenty-four hours at least, and then if vesication has occurred, the cuticle may be raised and beneath it will be found a small opening not exceeding a line in diameter, which penetrates the deep tissue and discharges pus. If the blister is applied during the first three days this is all sufficient for a cure; and if the disease has run longer than this, its coarse is shortened and the cure remarkably quick.

"The plaster should remain 48 hours when applied to the palm of laboring men, a fresh one being furnished at the end of 24 hours in these cases the opening may be enlarged as the quantity of pus is greater. The pain is greatly diminished during the action of the blister.

"Those who have experienced disappointment at finding no matter after laying a delicate finger open to the bone, and who have seen patients resort to all sorts of means to avoid the inevitable knife, will be most pleasantly surprised at the efficacy of the blister."

Useful Information.

A Very Useful Table.

The following table, computed from actual experience, will be found very useful in calculating the weight of loads, etc.—or the weight of any of the articles mentioned, in bulk. It shows the weight per cubic foot. All that is necessary, therefore, is to measure the bulk; ascertain the number of cubic feet in it; multiply this by the weight per foot, and divide by 2,000, when you have the weight per ton:

SUBSTANCE.	WEIGHT PER CUBIC FOOT.
Cast Iron	450 lbs.
Water	62½ "
White pine, seasoned, about	30 "
White Oak, " "	52 "
Loose earth	95 "
Common soil, compact	124 "
Clay, about	135 "
Clay, with stones	160 "
Brick	125 "

The following shows the bulk of a ton of different substances:

	CUBIC FEET.
Sand	28
Earth, compact	18
" loose	32
Clay	17
Half rotted manure, solid	36
" " " " if coarse, about	50
Timothy hay, moderately pressed	500
Clover, about	750

All that is necessary, therefore, in order to ascertain the quantity you have on hand in tons is to take the measurements as above, and if hay, divide by 500 or 750, as the case may be; if manure, by 36, etc.

THE POTTERY TREE.—Among the many vegetable products of Brazil the pottery tree of Para is not the least worthy of note. This tree, the *Moquilea utilis* of botanists, attains a hight of 100 feet up to the lowest branches. The stem is very slender, seldom much exceeding one foot in diameter at the base. The wood is very hard and contains a very large amount of silica—not so much, however, as the bark, which is largely employed as a source of silica in the manufacture of pottery. In preparing the bark for the potter's use it is first burned, and the residue is then pulverized and mixed with clay in varying proportions. With an equal quantity of the two ingredients a superior quality of ware is produced. It is very durable, and will bear almost any amount of heat. The natives employ it for all manner of culinary purposes. When fresh the bark cuts like soft sandstone, and the presence of the silex may be readily ascertained by grinding a piece of the bark between the teeth. When dry it is generally brittle, though sometimes hard to break. After being burned, if of good quality, it cannot be broken up between the fingers, a pestle and mortar being required to crush it.

A TALL CHIMNEY.—A furnace stack or chimney has just been built at the Meier furnaces-St. Louis, which is 203 feet high, 25 feet square at the base and 10 and a half feet at the top. The inside of the stack for the first 75 feet is lined with fire brick.

THE CAUSE OF CHANGE OF COLOR IN THE CHAMELEON.—The London *Medical Record* gives some interesting facts relative to the cause of change of color in the chameleon, which have been gathered from remarks made on this subject by M. Paul Bert, at a late meeting of the Société de Biologie of Paris. This animal, whose natural color is dark green, has the power of changing to pale green, and very pale yellow, this change of color being entirely due to the nervous system. The explanation of this phenomenon is thus given: "Under the skin, and communicating with it, are vessels filled with pigment, coursing through little canals which intersect, cross, and interlace each other in all directions at the back of the epidermis itself. This pigment is afterwards drawn back into the vesicles by the volition of the animal, and the chameleon then takes on a pale tint produced by a pale-yellow tissue, visible by its transparency." It has been discovered that the color of the animal is affected by light, and that if disturbed at night the side on which a light is thrown becomes pale, the other side remaining unchanged. So far no explanation of this curious fact has been suggested, and it offers a field for research and observation which may lead to very important results.

SOLDERING.—Every housekeeper may not know of what they are capable in the line of keeping their tinware in order. For the benefit of such, I will say that it is easier to solder such things than to pay a traveling tinker two prices for mending them. Take a sharp knife and scrape the tin around the leak until it is bright, so that the solder will stick. Then sprinkle on a little powdered resin; (they have liquid solder to sell, but resin will do as well;) lay your solder on the hole and with your soldering iron melt it on. Do not have the iron too hot or the solder will adhere to that. After two or three trials you can do a job that you will be proud of. If you do not own a soldering iron, procure one by all means; but when hard pressed, I have used the knob on the end of the fire shovel or a smoothe piece of iron, or hold a candle under the spot to be mended. Anything is better than stopping leaking pans with beeswax or rags. Try it, young housekeepers, and see how independent you will feel. Your pans should be dry when you take them in hand.

FRESCO PAINTING.—Fresco painting is so called because executed with water colors upon fresh plaster. This plaster is made of slacked lime and fine sand, and is applied upon a coating rough enough to make it adhere to it. The fresco needs a wall from materials tinctured with saltpetre, and the colors must be such as the lime does not change. When the artist has polished and made very smooth the surface to be painted, he traces upon it the previously prepared composition. The designs, of the size of the picture, are called cartoons, because prepared upon large sheets of paper glued together. Upon the wall the drawing is traced with a point of ivory or wood, or the contour of the drawing is pricked with a pin and a tampon dipped in charcoal passed along the lines of the holes, which fixes the design on the plaster. Afterward the artist follows the tracing with a sharp pointed pencil or stylus, and this indelible contour is called the nail of the fresco.

GAS-METRES.—A common belief. If there is one thing more than another in which we have little or no faith at all, it is as to the correctness of gas-meters. Their principle may be a good one, (good for the gas companies,) but, like "white men" that are "very uncertain." A journal open before us, the *American Manufacturer*, published at Pittsburg, Pa., has some rather startling exposures relative to the humbug played upon the consumers, not unfrequently, by these little machines. It is bad enough to pay exorbitant prices for illuminating gas, and to be supplied with a very poor article, but to be cheated in the measurement, and to be overcharged for the miserable stuff as to the quality supplied, is aggravating to the last degree.—*Boston Globe.*

SIZE OF BARRELS.—A president of an agricultural society calls attention to the fact that there are, in a standard legal barrel, only one hundred quarts, while the ordinary flour barrel most in use among farmers in the sale of potatoes and apples, contains nearly one-eighth more. Farmers sell their produce in flour barrels, and merchants transfer the same to standard barrels, making a profit on quantity as well as on the price. In the sales of eight hundred barrels of potatoes from a farm, the proprietor loses one hundred barrels, worth $250, for which he might as well be paid. The middleman, not the consumer, profits by this. Farmers, see to it that you employ the one hundred-quart barrels hereafter.

POLISHING BRASS.—Young engineers will find the following recipe a good one for polishing the brass work of their engines. Rub the surface of the metal with rottenstone and sweet oil, then rub off with a piece of cotton flannel and polish with soft leather. A solution of oxalic acid rubbed over tarnished brass soon removes the tarnish, rendering the metal bright. The acid must be washed off with water, and the brass rubbed with whiting and soft leather. A mixture of muriatic acid and alum dissolved in water imparts a golden color to brass articles that are steeped in it for a few seconds.

Domestic Economy.

ROAST TURKEY.—Rinse the turkey out with several waters and in the next to the last mix a teaspoonful of soda. Fill the body with this water, shake well, empty out, and rinse with clean water, singe off the hairs, and prepare a dressing of bread crumbs, add a small piece of butter, pepper and salt, and add thyme and marjoram, or sage if preferred. Wet it with hot water or milk. The liver, heart, etc. should be boiled and chopped fine and mixed with the dressing. The water in which they were boiled should be put in the dripping pan with which to baste the turkey. Dredge it with flour and salt before roasting, and baste often. With a brisk fire and young turkey allow ten minutes to a pound for roasting. Tie a string tightly about the neck when the craw is filled, and sew the body with strong thread. Remove this when the fowl is dished, When the turkey is lifted from the pan add a spoonful of flour wet with cold water to prevent its lumping. Boil up once and pour into the gravy boat. 'Hearth and Home' says "In carving a turkey, cut off the wing nearest you first, then the leg and second joint; then slice the breast until a rounded ivory shaped piece appears; insert the knife between that and the bone, and separate them; then turn over the bird a little, and just below the breast you will find the 'oyster', which you separate as you did the inner breast. Proceed the same way with the other side. The fork need not be removed during the whole process.' A sharp knife is indispensable. The platter should be drawn near enough to the carver for him to reach each part of the bird with perfect ease.

RABBIT CUTLETS.—Prepare the rabbits as you would for a stew; cut the different limbs into the size of cutlets—such as the shoulders cut in half, also the legs, with the ends of the bones chopped off, and pieces of the back, even to the half of the head. Have ready some bread-crumbs and the yelk of an egg beat up. Drop each outlet into the egg and then cover with bread-crumbs, as for veal cutlets. Fry them a nice brown and when you dish them pour round them some rich brown gravy, which may be flavored with tomato sauce if approved, and put round them rolls of fried bacon.

COOKING OATMEAL.—W. says: One reason why oatmeal is not more generally used as food is that, in the way in which it is usually cooked it requires constant stirring, which takes a good deal of time and attention. If, after the porridge is mixed, that is, as soon as the oatmeal is stirred into the boiling water, the cover is put on and the tin saucepan containing it placed in another pot of boiling water on the stove, and the water let boil, good oatmeal porridge will be made, without the least danger of its being scorched.

CANNED GRAPE PUDDING.—Pick and wash good sweet grapes--say Concord—and put in alternate layers with one-fourth the quantity of picked and washed rice, and sugar enough to sweeten. Fill up with water, and cook in hot water one hour after it begins to boil. Can as usual for fruit, and serve cold when wanted, either with or without a sauce of sweetened cream. This pudding is not likely to keep more than two or three months, owing to the liability of the grapes to deposit tartaric acid.

HAIR DRESSING.—A nice dressing for the hair is said, by a correspondent of the *Christian Monitor*, to be cold tea. She uses it twice a day, and insures a fine growth of beautiful, luxuriant and healthy hair, with less trouble, no danger of injury to scalp or hair, no expense, and in less time, than any, or all, of the quack mixtures, which are so loudly and persistently recommended.

SOAP AND SILVER.—Never put a particle of soap about your silver if you would have it retain its original luster. When it wants polishing, take a piece of soft leather and whiting and rub hard. The proprietor of one of the oldest silver establishments in the city of Philadelphia says that "housekeepers ruin their silver by washing it in soap suds, as it makes it look like pewter."

TO CLARIFY DRIPPING.—Put the dripping into a basin; pour over it boiling water, in which a teaspoonful of salt has been dissolved and keep stirring the whole to wash away the impurities. Let it stand to cool, when the water and dirty sediment will settle at the bottom. Repeat the operation twice with fresh water. When cold remove the dripping from the water and melt into jars.

ICING THAT WILL NOT BREAK.—Take one pound of pulverized white sugar, the whites of 3 eggs beaten until you can turn the dish upside down; one teaspoonful of flour or cornstarch added to it; flavor with lemon; flour the top of the cake as soon as taken from the oven; put on the icing with a large bladed steel knife dipped in warm water and then smooth the icing with it.

SHEEP'S TONGUE IN SAVORY JELLY.—Skin the tongues, lard them and cook them until they are quite tender, in good veal broth or any white stock. Take out the tongues, boil down the liquor to a stiff, clear jelly and pour enough of it over them to cover them. To be eaten cold.

SQUASH PIE.—Three cups of milk, two cup, of squash, one cup of sugar, two crackers, rolled two eggs, lemon to taste. This makes two pies.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

TABLE OF CONTENTS.

EDITORIALS AND GENERAL NEWS.—Improved Machine for Unloading Grain; Academy of Sciences; Mining in the Southern Counties. 401. Close of the Volume and Year; Work on Mining Claims; Improvement in Astronomical Clocks; Australian Intercolonial Exhibition; Holiday Greetings; Agriculture in the State University. 408. Hydraulic Mining in California; Kipp's Upright Engine; Tunnels for Developing Lodes; Industrial Items, 409. Patents and Inventions; The Katie King Fraud; A Good Result; Kansas Sufferers, and other Items of News, 412.

ILLUSTRATIONS.—Improved Machine for Unloading Grain, 401. Newly Made Mushroom Beds; Pyramidal Mushroom Bed on Floor of Cellar; Mushroom Bed on Rude Shelf Against Wall of Cellar; Mushrooms Grown in Bottom of Old Cask, 406. Hydraulic Mining in California; Kipp's Upright Engine, 409.

CORRESPONDENCE.—Tybo—Its Mines and Mineral Resources, 402.

MECHANICAL PROGRESS.—Singular and Important Phenomenon in Regard to Iron: The Fireless Locomotive System; Condensation in Steam Cylinders; Wire Rope for Transmission of Power, 403.

SCIENTIFIC PROGRESS.—Vanilla from Pine Trees; Phenomena of Sound; New Method of Filtration; Darwinian Experiments; Scientific Work; Preparation of Methylic Ether; Imitation of Lace or Silk by Photography; Photographing the Comet; Acid in the Gastric Juice, 403.

MINING STOCK MARKET.—Thursday's Sales at the San Francisco Stock Board; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 404.

MINING SUMMARY.—From various counties in California, Nevada, Utah, Colorado, Idaho and Montana, 404-5.

DOMESTIC ECONOMY.—Roast Turkey; Rabbit Cutlets; Cooking Oatmeal; Canned Grape Pudding; Hair Dressing; Soap and Silver; To Clarify Dripping; Icing that will Not Break; Sheep's Tongue in Savory Jelly; Squash Pie, 407.

GOOD HEALTH.—Effects of Imagination; Let Blisters Alone; Burning at a White Heat Painless; Lime Vapor in Membranous Croup; Treatment of Felons, 407.

USEFUL INFORMATION.—A Very Useful Table; The Pottery Tree; A Tall Chimney; The Cause of Change of Color in the Chameleon; Soldering; Fresco Painting; Gas Meters; Size of Barrels; Polishing Brass, 407.

MISCELLANEOUS.—Changing Smooth Bore Cannon to Rifles; New Oregon Mines; Handling Sugar Beets; Lick Observatory; How Long will Soils Retain Effluvia? Working Green Wood; A Freak of Nature, 402. Mushroom Culture; Beautiful Horticultural Importations; Curious Trees; In Memoriam; California not Considered; Winter Irrigation and Drainage; Imitation of Marble that can be Polished; Narrow Gauge; New Bridge, 406. Refining Base Bullion in San Francisco; Pig Iron, 412.

Close of the Volume and Year.

Here we are, dear reader, at the end of another volume and at the close of another year. While we put old 1874 on its back, and look forward to the bright new face of the incoming year, let us rejoice that it has been so well with us for the twelve months past. We have been spared the ills of war, of famine, of pestilence, and of everything whatever in the way of a national calamity. As a community, even old "hard times" has kept aloof from our shores. Our mountains have yielded an unusual amount of their precious treasure, and have brought us, as a Christmas present, a bonanza of bewildering wealth—whose value no one can determine. Our plains and valleys have teemed with such an abundance, that the fleets of the world are burdened to move it away. For all of these things let us be thankful.

We trust that our intercourse with our subscribers has been both pleasant and profitable—to us it certainly has been pleasant, if not profitable. As we take up the work of the coming year we shall aim to do so with renewed energy and zeal. We are not in the habit of making promises; we prefer rather to point to what we have done as an earnest of the future. The publishers of this paper have been for some fifteen years engaged in industrial journalism in California, and they take an honest pride in the success with which their efforts have thus far been crowned. All we promise is that our aim in the future shall be to continue the same steady and sure progress that has characterized the past. With many thanks to all who are with us as readers or helpers, we close the twenty-ninth volume of the MINING AND SCIENTIFIC PRESS.

Work on Mining Claims.

After all the warnings given by the newspapers of the coast, the miners who now allow their claims to be forfeited for non-compliance with the laws of the United States, deserve to lose them. The term "claim," as understood by the land office, is held to mean that portion of the vein or lode and adjoining surface to which the claimant has the right of possession in virtue of a compliance with the laws of the United States, and the local customs or rules of miners, not in conflict therewith. In order that those who have not a copy of the mining law of May 10th, 1872, may understand it in detail we quote below the 5th section of the act, which refers to the general expenditures required:

SECTION 5. That the miners of each mining district may make rules and regulations, not in conflict with the United States, or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located by reference to some natural object or permanent monument, as will identify the claim. On each claim located after the passage of this Act, and until a patent shall have been issued therefor not less than $100 worth of labor shall be performed, or improvements made during each year. On all claims located prior to the passage of this act, $10 worth of labor shall be performed or improvements made each year for each 100 feet in length along the vein, until a patent shall have been issued therefor; but where such claims are held in common, such expenditure may be made upon any one claim; and upon a failure to comply with these conditions, the claim or mine upon which such failure occurred shall be opened to relocation in the same manner as if no location of the same had ever been made: *Provided*, that the original locators, their heirs, assigns, or legal representatives, have not resumed work upon the claim after such failure and before such location. Upon the failure of any one of several co-workers to contribute his proportion of the expenditures required by this Act, the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-worker personal notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if, at the expiration of ninety days after such notice in writing or by publication, such delinquent should fail or refuse to contribute his proportion to comply with this Act, his interest in the claim shall become the property of his co-owners, who have made the required expenditures.

The time for the first annual expenditure was extended to January 1, 1875. It may be well to state that the Commissioner has decided that the construction placed upon the section is that all claims located *after* May 10, 1872, not less than $100 shall be expended in labor or improvements during each year, and that the year shall commence from the *date of the location of the claim*. This may not be generally known, but was decided September 14, 1872.

Of course when a mine is patented no further annual expenditures are required either by Congress or local laws, as local laws must conform to the general law. It must be understood, however, that application for a patent is not equivalent to a patent in this connection, and the work must be done even if the patent proceedings are pending.

It may be stated here also that many miners who are not just ready to do all the works, will rely on the strict reading of the law as above given in section 5 of the Act. It says, "*Provided*, that the original locators, their heirs, or legal representatives have not *resumed* work upon the claim after such failure and before such location." This does not say the work must all be done exactly at that time, but simply that it shall be *resumed*. Accordingly quite a number of people who propose patenting their ground, intend only to be on the ground on the 1st of January, do one day's work and quit, relying on the law to bear them out. Providing they do the work within the year or patent their claims they think they will be all right. The best way, however, is to do the work and be done with it. Some remarks in this connection with relation to tunnels will be found in another column.

THE South Yuba Canal company is now running through its ditches to the different mining companies in the eastern portion of the county of Nevada 120,900,000 gallons of water daily.

A GRAVEYARD has already been started at Panamint. The first occupant is Cal. Mowry, late of Pioche. Andy Laswell did the shooting. He too was a graduate of Pioche.

IT is stated that all the Pacific coast Senators and Representatives will work together for the abolition of the duty on quicksilver.

Improvement in Astronomical Clocks.

The mechanism of the astronomical clock, which has greatly contributed to the accuracy as well of astronomical observations, as of the determinations of longitudes, has been carried to a degree of wonderfully delicate perfection. Its correction for varying temperatures has been so complete and its rate so uniform, that the astronomer has hitherto thought best to let it run without disturbing it by attempting to adjust the length of the pendulum, even if it was uniformly gaining or losing on the time it was desired to keep. Yet the very great inconvenience to the practical astronomer in the observations, of having his clock show a different face time from that given by the ephermis, and the still greater reluctance to stopping his clock when once set going has awakened the ingenuities of astronomers and mechanics to devise a means of lengthening or shortening the pendulum without disturbing its vibration.

Success had only half crowned their efforts. By fixing a small funnel on the face of the pendulum, and dropping small shot into it, they succeeded well in shifting the center of gravity up towards the point of suspension, thus shortening the pendulum without disturbing its vibrations. But when they attempted to lengthen the pendulum, by extracting shot from the funnel, without disturbing its vibrations, they were baffled in their efforts. To drop the shot into the funnel was easy enough, but to get them out was the difficulty. With a pair of ordinary tweezers and various other mechanical devices, they attempted to lift the shot out, but these all disturbed the vibrations of the pendulum, and were hence inadequate.

Mr. T. J. Lowry, of the United States Coast Survey, has hit upon a simple device for the solution of the problem of lengthening the pendulum of an astronomical clock without stopping or disturbing its vibrations. At the last meeting of the California Academy of Sciences, he read a short note on the subject, and after explaining the matter as above, said that on seeing the difficulty, it had occurred to him that if, instead of using the small lead shot, we used small iron shot, we could pick them up with a magnet; in fact they will pick themselves up and jump to the magnet if it be held in close proximity to them. Of course the magnet should be of small diameter and not very powerful, so as to avoid picking all the shot out at once, or essentially disturbing the vibration of the pendulum by its attraction. Thus we see gravity aids us in shortening the vibrating pendulum, and magnetism assists us in lengthening it. This, Mr. Lowry believes, will be found a solution of this problem as effectual as it is simple.

Australasian Intercolonial Exhibition.

The intercolonial exhibition of the Australian Agricultural Society will be held in Sydney next year, opening on the 9th of April. Mr. Wm. Westgarth, Commissioner from Australia, has recently come to this city in order to procure samples of California products and manufactures, machinery, agricultural implements, etc. Mr. Westgarth has brought with him letters to many of our prominent merchants, and has already accomplished considerable. The schedule of exhibits embrace both agricultural and non-agricultural exhibits, including the fine arts, apparatus and application of the liberal arts; in fact, all the products and industries of the colonies. A section has been set aside in the exhibition for the articles from California, and it behooves our manufacturers and artisans to better themselves and get up a creditable display. Viewed simply as a matter of business alone, it would be of benefit for us to send a large exhibit, as the communication between the two countries is likely to be much more intimate in the future than in the past. It is Mr. Westgarth's intention to establish, after the conclusion of the exhibition, an agency in Sydney for the exclusive sale of California products; and in view of the regular steamship communication now established between the two countries, the enterprise promises to be thoroughly successful. Communications for Mr. Westgarth should be addressed care of J. C. Merrill & Co., or to him at 619 Pine street, and he will gladly make arrangements with those who may choose to become exhibitors.

He will give his personal attention to the display and will take charge of shipments from here. He leaves from here on the steamer which starts about the 30th of January, and goods which are to be sent should be ready to go with him.

COPPER.—Jas. Lewis & Sons, Liverpool, in their report on ores and metals for Dec., report a further advance of £5 per ton in the value of Chili bar copper during the month of November, which was chiefly ascribed to the notable diminution in the stocks of Chili produce in Liverpool and Swansea, of Australian in London, and of Chili in Havre. Latest quotations were: Bars, £87 10s. to £88 for good ordinary; £88 10s. to £89 for picked, and £90 for special brands. Ore, 17-6 to 17-9 per unit. The stocks of west coast produce were estimated on the first of December at 10,510 tons fine, against 12,350 tons on the 1st of November.

Holiday Greetings.

The date of our paper, December 26, places us "one day after the fair," in wishing the friends and patrons of the PRESS a merry Christmas; but it does not deprive us of the satisfaction of offering our friendly, hearty, holiday greetings. And though our date is a day after Christmas, the PRESS was printed, and our greetings put in type in ample time for us to send the wish for a merry Christmas in its appropriate time; for, as in connection with Thanksgiving day, we managed to "steal a march" on time sufficient to enable all hands to keep the holiday. We shall do the same with the PRESS of New Year's week; and will take this occasion to bespeak for all a happy New Year. The idea that the presence of winter clothed in a massive blanket of snow, his venerable beard adorned with icicles, in order to make these wintry holidays duly appreciated, is a mere fancy. They are really creations of the heart, and not mere ordinations of religious or political bodies, or matters of social custom. People seem resolved to be merrier on the first of these and happier on the latter, than on other days of the year; and we all know that the extra amount of happiness thus secured is not purchased with the good wishes that are expended in our behalf, but arises from that condition of our hearts which in all sincerity wishes good to others. It is a mighty achievment for human nature to attain this position, even once or twice a year. It is good evidence of the nature of the soil of the social heart; and although it would be unreasonable for us to expect to have it keep up to this standard, it will be well for us to look to it that it does not fall below it. We therefore contribute our mite in this holy service by sending a hearty holiday greeting to all our friends.

Agriculture in the State University.

The Regents of the State University have received a letter from Professor Hilgard by which it appears that he may be expected to begin his work as Professor and his residence at Berkeley, early in the next college term, which begins January 13th.

The Regents have also received a letter from Professor Bessie of the Agricultural College of Iowa, accepting an invitation to deliver some lectures before the students in agriculture. He will give several short courses on the relation of the sciences to agriculture, on the improvement of varieties, and a third on the practice of agriculture. These lectures will commence at the beginning of the next term, January 13th.

The work of the nursery and propagating house has been carried forward with great vigor during the last few months. Many thousands of plants have been started and as the wet season advances will be transferred to their appropriate places. The beginning of an orchard, a nursery, an arboretum, and a botanic garden has thus been secured. We are also informed that certain agricultural experiments, in addition to these in horticulture and arboriculture, are also to be instituted—so far as the very limited means at command will permit.

THE FANDANGO MINE.—The "Fandango" is the name of a quicksilver mine lying next on the east to the Rattlesnake mine, in Sonoma county. They have a tunnel in on the claim over 100 feet long. The "ledge matter" is about 28 feet wide, and assays all the way from one to five per cent. The mine has been lately examined by an expert, who thinks that with more work upon it, the necessary furnace, etc., it will be a good paying property. Four men are now at work on the mine, and ten more will shortly be added. A tunnel is to be commenced when this force is put on, which will tap the deposit 200 feet from the surface. A furnace is to be erected at the mine shortly.

MINING SUIT.—In the Circuit Court for the District of Columbia, on the 19th inst., a bill was filed in behalf of Allen Schenck, of Boston, and Norris W. Mundy, of Chicago, for an injunction against Joseph Walker, and others, to perpetually restrain them from making use of the Highland Chief silver mine, in Salt Lake district, Utah. Complainants allege that the defendants illegally took possession of this lode in July, 1872, and have since been holding possession. Damages of the complainants are to the amount of $500,000, for which they claim compensation.

THE daily yield of ore from the principal Comstock mines during the past week has been as follows: Crown Point, 500 tons; Belcher, 450 tons; Consolidated Virginia, 300 tons; Ophir, 245 tons; Dayton, 65 tons; Sierra Nevada, 60 tons.

THE Southern Pacific railroad is making rapid progress toward Tehachepi pass, on its way to Los Angeles. The grading is finished to a distance of 14 miles east from Bakersfield, and the iron laid for seven miles.

THE Butte *Record* is informed that the iron for the first 25 miles of the road from Benicia to Vacaville, on the Red Bluff and Benicia narrow-gauge, is now on the way to this State.

Hydraulic Mining in California.

No. 5.

The Opening of Hydraulic Mines.

The great gravel deposits fit for hydraulic mining rest in channels or basins of unknown depths, and it is evident that, unless the depth of the channel can be ascertained beforehand, certain risks have to be taken in boring the tunnels, indispensable for almost all hydraulic operations. In the principal hydraulic mines in the State early operations were commenced from the easiest point of access, without much regard to the lasting sufficiency of the "open cut" or tunnel. The natural consequence was that only a small portion of the mine could be worked by existing facilities; the grade had to be cut down from time to time, and in most cases the constant improvements absorbed or exceeded the whole production of the mine.

The expenditures for opening a hydraulic mine, furnishing it with sluice-boxes, under-currents, etc., besides the introduction of water, generally amount to many thousands, perhaps hundreds of thousands of dollars, and only a large area of hydraulic mining ground will warrant such an outlay. There should, therefore, be a reasonable proportion between the estimated outlay for improvements and the mining ground at command. Much can be done by the consolidation of different interests. A plat of hydraulic mining ground, representing from eighty to two hundred acres, constitutes a security for any capital which can legitimately be employed in its improvement.

Location of Tunnel.

This should be low enough to work the whole body of mining ground. If the depth of the channel can be ascertained by shaft or incline it will be the best policy to do so; if, however, too many difficulties, such as quicksand, or too great a depth of ground, interfere, it will be better to choose at once the lowest point attainable for a tunnel, always, however, with due regard to sufficient fall from the mouth of the tunnel for a long line of sluice boxes, with under-currents, dumps, etc.

In choosing this starting point for a tunnel, not only the probable depth of the channel must be taken into account, but also the fact that the necessary grade of the tunnel, say from 3½ to 4 feet per hundred, will reduce its depth, for each additional thousand feet, 35 to 40 feet. Hence, if the extent of the claim to be worked is considerable, say 2,000 feet on the channel and 4,000 feet across it, and the tunnel, as is generally the case, runs across the channel, it will be necessary to have the tunnel in the middle of the channel, at least 40 feet lower than the bed-rock, or bottom. This is illustrated by the subjoined diagrams.

It will be seen that the dotted line toward *D E*, on the left side, is still somewhat in the bed-rock. This is desirable, not only for the lateral extension of the mine, but also for the reason that sluice boxes, at a reasonable depth in the bed-rock, always facilitate the work in a hydraulic mine, offering chances for grades in all directions to wash the gravel, etc.

Size of Tunnel.

This must depend to some extent upon the required work, the quantities of water at command, and the length of the season annually during which the water lasts. Tunnels 5 feet wide and 6 feet high were considered in former years sufficiently large for any purpose, but since hydraulic mining has been conducted on a much larger scale the size of tunnels, in hight and width, has increased accordingly. They are now generally constructed 7 feet wide, and 8 feet high for single runs of flumes or sluice boxes, and in those mines where there is a sufficient quantity of water for eight or nine months in the year, and where the remaining three or four months can be used for a thorough cleaning up, repairing, etc.

A tunnel of such a size, with a 6-foot flume and 4-foot grade per hundred, would admit the use of 2,000 or 2,500 inches of water; the size of tunnel may be reduced if the supply of water is much less, other conditions being the same. For mines which possess a lasting supply, say 2,500 to 3,000 inches the whole year round, a much larger size would be desirable, admitting a double run of sluice boxes, and thus an uninterrupted washing.

In former years, the idea of running a tunnel 12 feet wide and 9 feet high might have deterred the boldest; but at the present day, when the diamond drill has come into use, such undertakings can be prosecuted with a comparatively small additional expenditure and no loss in time. It has been found that it takes almost as much time to remove the fragments of stone excavated by the diamond drill as for drilling and blasting; and in consequence, the diamond drill is only employed for half the time in tunnels of limited size. But where, after the blasts are exploded, the drilling machine can be adjusted again, without interfering with the car by which the fragments of rock are removed, a tunnel of double width can be run in the same time.

Grade of the Tunnel.

This depends partly on the quantity of grade to spare. Where there is plenty of fall, a liberal grade, say 6 inches per 12 feet, or about 4 feet per hundred, ought to be given.

More grade in large flumes becomes dangerous for the pavement of the flume; a 6-inch grade will not only carry off any desirable quantity of gravel, etc., but materially assist by the very rapid motion produced, in the breaking up of the gravel and liberation of gold. Where the fall is more limited the grade may be reduced to 5 inches in 12 feet, or 3½ feet per hundred. Whenever less grade has to be applied, difficulties in the removal of the "pulp," and particularly of larger stones, will arise, and many hands will have to be employed to push the material along.

Line of Tunnel.

This should be perfectly straight wherever practicable, in order to facilitate not only the general flow, but also the measurement and calculation of all those points, the correct location of which is necessary. Underground measurements of curves are for the simple miner extremely difficult; the magnet loses its reliability, being disturbed by the iron in the bed-rocks, and generally a "tapping in the dark" ensues. Due attention to the straight line in the tunnel will avoid all these difficulties, and insure, besides, the shortest distance.

General Considerations.

It is not advisable to open a hydraulic mine too close to the rim-rock. As already remarked great bodies of quicksand lie close to the rim-rock; moreover, the occurrence of pipe clay, and perhaps the want of rich "pay gravel," may combine to render the work tedious, unprofitable, and discouraging; and, finally, the mining ground brought under control will be comparatively insignificant.

In the diagram given the tunnel *A B* ought to have been prolonged at least to the point *D* before being connected with the gravel deposit. The chimney *B C* admits only the working of the deposits lying between *C* and *E*, which, for the reasons stated, is of but little value. It will be acknowledged by most of the managers of hydraulic mines, that generally either too little importance has been attached to the point where the mine was opened for work, or that an undue outside pressure and a cry for dividends have forced the adoption of half measures against the soundest argument, and that labor and time have been wasted in many instances by the inordinate desire of saving both.

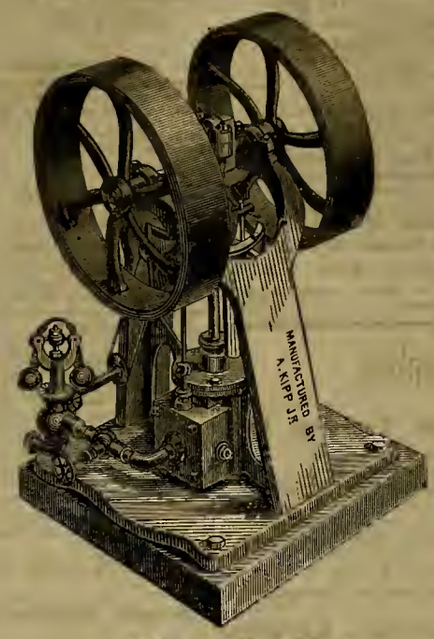
—*Condensed from an article by Charles Waldeyer, in the last Annual Report of the U. S. Commissioner of Mining Statistics.

The developments at the lower levels of the Justice mine indicate the presence of one of the regular ore chimneys of the old Comstock, and the powerful new hoisting works which will be completed in two or three weeks are expected to do great things in the way of rich ore extraction.

Kipp's Upright Engine.

The accompanying illustration represents Kipp's upright engine, one of which, of small size, was exhibited at the late Mechanics' Institute Fair and also the State Fair, where it ran a large Sinther pump. Both engine and pump were exhibited by J. M. Keeler & Co., of 306 California street. The engine was awarded a diploma at the State Fair. Certain important advantages are claimed by the manufacturers over other upright engines. The style of frame is both symmetrical and strong, and its lines and proportions bring the whole into a compact form so that it occupies much less space than is usually the case.

The cylinder, steam chest and piston guides are cast solid in the frame, giving a mutual support and making it impossible for it to vary from its original exactness in working. Again, the piston guides and steam cylinders are bored or turned out at the same time, and, of course in the same line, so it is difficult for the engine to get "out of true" in working. The engine has the latest improved slide valves, which are easily adjusted. The shaft and piston rods are of steel. The bearings are of the most approved kind, and all the adjustable parts exhibit good workmanship, the engine running almost noiselessly.



KIPP'S UPRIGHT ENGINE.

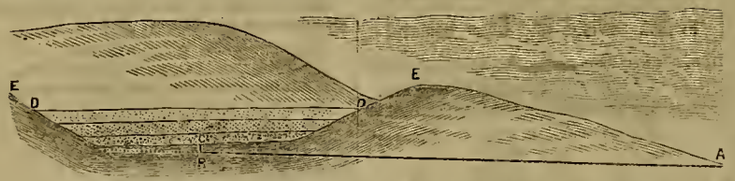


Fig. 1. A B, tunnel to middle of channel; B C, distance (43 feet) from tunnel to bottom of channel; D D, extent of workable gravel; E E, the two shores of the channel.

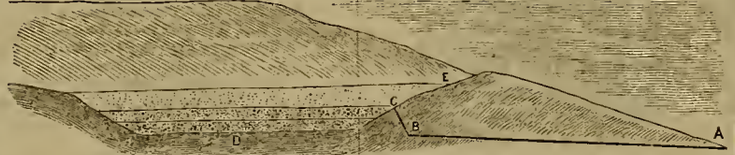

Fig. 2. A B, tunnel; B C, chimney; D, bed-rock.

The governor is simple, effective and ingeniously connected, and, on the whole, it is claimed that for workmanship, compactness, durability, and ease in handling, the engine has no equal in the market. Messrs. Cubery & Co., 414 Market street, are running power presses with one of these engines, where it may be examined by those interested and inquiries made as to cost of fuel as compared with other engines. The price asked for it gives it a fair advantage in the market.

Recent advices from Julian district, San Diego county, report that the Chariot mill, which had been stopped for a few days, owing to an accident, is now running again. The Whitney ten stamp mill is now in complete order, and will start up on Kentuck rock next Monday. After next Monday there will be thirty stamps running day and night in Banner district.

A thousand shares of the Abbott quicksilver mine, Colusa county, were sold last week for $20,000, and a fourth interest in the Turner mine for $10,000,

Tunnels for Developing Lodes.

A dispatch dated Washington, Dec. 17 says: "The House bill reported without amendment from the Senate Mining Committee to-day, provides that money expended in running tunnels for developing lodes shall be considered as expended on the lodes, whether located before or after May 10, 1872, and work shall not be required on the surface to hold lodes, as provided by the mining law of that date."

This bill is the one introduced last session which "went over" when Congress adjourned in June. It is an amendment to the Act of May 10, 1872, and reads as follows:

"Be it enacted, etc., that the 5th section of said Act be, and the same is hereby amended so that where a person or company shall run a tunnel for the purpose of developing a lode or lodes, owned by said person or company, the money so expended in said tunnel shall be taken and considered as expended on said lode or lodes, whether located prior to or since the passage of such Act; and such person or company shall not be required to perform work on the surface of said lode or lodes, in order to hold the same as required by said Act."

Willis Drummond, Commissioner of the Land office, in August, 1872, decided that the expenditure in running a mining tunnel, before a lode was struck thereon, was not tantamount to expenditures on the claim. This construction of the law was approved by the Secretary of the Interior. However, in May 1874, W. W. Curtis, Acting Commissioner, wrote to Senator Sargent in answer to an inquiry, and said:

"Referring to your recent personal call, I have to state that where a tunnel is run for the development of a particular vein or lode, it is held by this office to be work upon that vein or lode, within the meaning of mining Acts of Congress. The required expenditures may be made either from the surface of a mining claim or in a tunnel run for the development of such mine."

The decision of Commissioner Curtis, coming later, is now the one which holds good. The Act of May 10, 1872, requires ten dollars worth of labor each year for each 100 feet along the vein until a patent is issued on claims located prior to the passage of the Act; and one hundred dollars worth of work annually on claims located after the passage of the Act. In the decision of Mr. Curtis, he makes no distinction of claims located before or after the passage of the Act, and miners would be justified in conforming strictly to the language of his letter. If the rulings of the courts would agree with his decision there would be no need for the amendment proposed.

Up to the time we go to press we have received no notification of the final passage of the amendment; and although the matter is of much importance just at this time, it may be several days before the bill is considered. We have given our readers an explanation of how the matter stands now; and they can judge for themselves whether to risk the work done on tunnels as satisfying the law requiring expenditures. Those who have done all the work on tunnels can very well afford to laugh at "jumpers" on the strength of Mr. Curtis' letter, whether the amendment passes or not.

McClelland, Phillips & Co. have recently sold to a San Francisco company their mining claim known as the Dry Gulch claim, consisting of 160 acres of gravel, situated about three miles above Pleasant valley, Eldorado county. The parties purchasing have also bought Davenport's ditch, which is about five miles in length, and conveys a good head of water to the claim.

The new district of Coso, about fifty miles from Panamint, Inyo county, is now looming up. Deposits of smelting ore, such as exist in Cerro Gordo, have been discovered, and a large camp is springing up. Many people have gone there from Panamint, and it will afford a fine outlet for the overflow of that place.

The ore breasts above the 1400-foot level, and between the 1300 and 1200-foot levels of the Consolidated Virginia mine, show the finest grade of ore, and are yielding the regular daily average quantity required to keep the mills in constant operation.

The ore in the Ophir mine dips to the east and north, and continues to widen as a greater depth is attained. The ventilation of the mine is excellent, and the future of the Ophir, as indicated by the vast amount of ore in sight is very flattering indeed.

The Arizona mine at Unionville has shut down, and all of the workmen are discharged. It is said that the mine has not paid expenses for the past year, and the recent assessment of $1 per share, amounting to $48,000, was levied to square up the loss.

A company has been organized to establish a foundry and machine shops for the making of machinery and castings, agricultural implements, etc., at Albina, Multnomah county, Oregon, with a capital stock of $50,000, in shares of $100 each.

The Mining & Scientific Press

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Miners, Assayers, Millman, and Metallurgist in the United States should take it.

Pacific Coast Mechanics, Engineers, Inventors, Manufacturers, Professional Men, and Progressive and Industrial Students should patronize its columns of fresh and valuable information.

Mining Engineers, Superintendents, Metallurgists, Mine Owners and Mine Workers throughout the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Intelligent thinkers throughout the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.

This compound of the vegetable alteratives, Sarsaparilla, Dock, Stillingia and Mandrake with the Iodides of Potassium and Iron makes a most effectual cure of a series of complaints which are very prevalent and afflicting. It purifies the blood, purges out the lurking humors in the system, that undermine health and settle into troublesome disorders. Eruptions of the skin are the appearance on the surface of humors that should be expelled from the blood. Internal derangements are the determination of these same humors to some internal organ, or organs, whose action they derange, and whose substance they diaease and destroy. AYER'S SARSAPARILLA expels these humors from the blood. When they are gone, the disorders they produce disappear, such as Ulcerations of the Liver, Stomach, Kidneys, Lungs, Eruptions and Eruptive Diseases of the Skin, St. Anthony's Fire, Rose or Erysipelas, Pimples, Pustules, Blotches, Boils, Tumors, Tetter and Salt Rheum, Scald Head, Ringworm, Ulcers and Sores, Rheumatism, Neuralgia, Pain in the Bones, Side and Head, Female Weakness, Sterility, Leucorrhœa arising from internal ulceration and uterine disease, Dropsy, Dyspepsia, Emaciation and General Debility. With their departure health returns.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street,
San Francisco

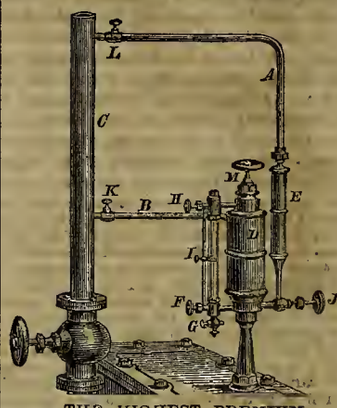
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Man factured by California Brass Works, 125 First street, S F. 24v23

BALL'S
SWEEPING DREDGE,

A NEW AND VALUABLE

CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company) Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

Froiseth's New Sectional, Topographical and Mineral

MAP OF UTAH.

SIZE, 40 BY 56 INCHES; SCALE, 8 MILES TO AN INCH.

Handsomely engraved on stone, colored in counties and mounted on cloth, showing the Counties, Towns, Rivers, Lakes, Railroads, Mines and Mining Districts throughout the Territory, and all GOVERNMENT SURVEYS made to date. Price, mounted, $3; Pocket form, $5.

—ALSO—

New Mining Map of Utah,

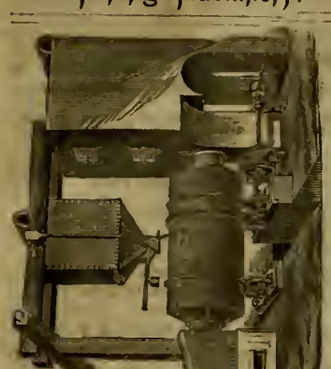
Showing the boundaries of the principal mining districts, some 30 in number, adjacent to Salt Lake City. Price, pocket form, $2.50.

—ALSO—

Froiseth's New Map of Little Cottonwood Mining District and Vicinity.

Showing the location of some 400 mines and tunnel sites, together with the mines surveyed for U. S. Patent. Price $3. For sale and mailed to any part of the globe, on receipt of price, by A. L. BANCROFT & CO., A. ROMAN & CO., and LECOUNT BROS. & MANSUR, San Francisco. 10v25-tf

Mining Machinery.



TEATS' PATENT FURNACE.

TEATS' PATENT FURNACE

For Roasting, Desulphurizing, Chloridizing and Oxidizing Ores, etc. For the reduction of Gold, Silver, Lead and other ores, saving a larger percentage, at less cost, than any other invention now in use. Chloridizing Silver ore more thoroughly, in less time, with less fuel, salt and labor; also roasting Lead ore preparatory to smelting, better and cheaper than any other invention. The Furnace is so constructed that one man, of ordinary ability, tends five or more furnaces; controls them with ease; adding heat or air, stopping or starting at will; charging and discharging with ease. Also, Patent "Conveying Cooler," for conveying and cooling roasted ores, heating the water for amalgamation and the boilers at the same time. Saving the large space in mill (covered with brick or iron), and the labor of two men per day, exposed to the poisonous chlorine gases. Also, Patent Air Blast "Dry Kiln," for drying ores direct from the mine or breaker, saving fuel and labor heretofore necessary in drying ores for dry pulverizing. For description refer to MINING AND SCIENTIFIC PRESS, No. 18, October 31, 1874. For particulars address

TEATS & BREED,

No. 12 West Eighth Street, Cincinnati, Ohio

Circulars, &c., will be furnished, if required.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering two or four sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, baryta and quartz; and pyrites from quartz.

Added to a battery of stamps these machines constitute a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 15 or 20 tons per 24 hours.

For particulars apply to,

F. CAZIN, M. & C. E.

Supt. Denver Concentration and Smelting Co.

At Denver, Colorado, Lock-Box 2225, or corner of Blake and 32d streets. ag8-16p

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

Eastern Perodicals BY THE Year, Month, or Numb

Pig Iron.

The Pacific Coast is full of Mines, Mioerals and Metals. Every year new sources of metallic and mineral wealth are discovered—every year it is becoming more and more developed. Iron, the king of metals has long been known to have been present in ahundance, but it is only of late that the Iron deposits of the coast have been at all utilized. Oregon has led the way, and after a period ot suspension has been sending to this market for many months a very superior quality of Iron, and one that commands the highest price.

California is about to follow. A New York Co. are about to work the ore beds of Shasta, and having determined to locate their works in Sacramento, the citizens of the State capital have raised several thousand dollars to purchase a site for them. Sacramento knows the value of such an industry, and her people are expending a few thousands in order that hereafter they may gain millions. As a central location both for shipping the manufactured Pig Iron, and for receiving the crude ore, Sacramento is probably unequaled. And it has other advantages which do not less recommend it. It is in close proximity to the as yet undeveloped Coal beds of Lincoln, and even should the product turn out to bc unsuitable for smelting purposes, the two splendid rivers that unite their waters before it, with their hundreds of branches reaching into the Sierras, afford unequaled facilities for floating down lumber to feed the furnaces.

With the development of the Iron resources of California, there is a great industrial future before her. The Central Pacific Railroad and its connections use up 46,352 tons of Iron every year; with the development of railroad building in the State, this amount will be largely increased. There is used in this city and State about 17,000 tons of Pig and manufactured (exclusive of railroad) annually. So that for a long time, the new works would find enough to do in supplying our local wants in Pig and manufactured Iron. But there is a much wider field open before them. When the producers of the ore and the manufacturers are united in one and the same company or individual, California or the Pacific Coast can produce Iron cheaply enough to compete for the Iron and Hardware trade of the world.

If what business men in the Iron trade of this city tell us be correct, vast fortunes must have been made by the Iron men of Pennsylvania, not the manufacturers hut the ore men. The following are quotations of actual sales of Gray forge Iron, delivered at Pittshurg, on four months time, bituminous Coal Iron smelted from Lake Superior Ores:

1855 Dec	$50 00	1872 Sept	$52 50
1855 May	44 00	Oct	50 00
Sept	45 00	Nov	45 00
1867 Jan	48 00	Dec	40 00
1868 Feb	36 50	1873 Jan	40 00
May	35 50	Feb	40 00
Sept	40 00	March	43 00
1859 Jan	38 50	April	42 00
May	38 00	May	43 00
Sept	37 50	June	38 00
1870 Jan	37 50	July	35 00
May	33 00	Aug	34 25
Sept	31 00	Sept	34 00
Nov	30 00	Oct	33 00
1871 Jan	31 00	Nov	30 00
May	33 00	Dec	30 00
Sept	35 00	1874 Jan	31 00
Nov	40 00	Feb	31 00
1872 Jan	40 00	March	30 00
Feh	41 00	April	27 00
March	45 00	May	27 00
April	50 00	June	27 00
May	55 00	July	27 00
June	55 00	Aug	25 50
July	50 00	Sept	25 50
Aug	53 50	Oct	25 50

After paying freight, etc., this is equal to $23 in the furnace yards of Mahoning and Shenango Valleys. Now our informant stated that Pig Iron ought not to cost more than $12. That it ought not to cost more here is evident. The ore costs $14.75 to the ton of Pig Iron in Pennsylvania; here it will only cost $2.50, leaving a difference of $12.25 in favor of California. Eastern Iron in the furnace yards is worth $23 in currency, or $21 in gold, and deducting say $12 from this there is left $9 per ton as the cost here. Making every allowance, however, it ought not to cost more than $12 to $15.

This is a most important fact, for if Pennsylvania or Ohio can sell Pig Iron at a profit at $12, there is no reason why California should not do so too, and why we might not proceed to manufacture and supply the whole countries bordering on the Pacific with Hardware.

At any rate the inauguration of the works at Sacramento is laying the foundation stone of a grand industrial future for us. Sacramento will not alone have the honor of lighting up the Iron furnace fires of the Coast—Humboldt and other localities even witb superior facilities will follow suit. In Humboldt county there is not only found abundance of Iron, but illimitable forests of hardwood Lumher, close at hand and suitable for making the finest kind of smelting Charcoal. Even if we did no more than supply our own needs we would be relieved from the odium of sending 17,000 miles for Iron, with sufficient to supply the world for centuries lying unutilized at our doors.—*S. F. Journal of Commerce.*

The Grase Valley *Foothill Tidings* of Satnrday saye: Miners abont here, wbo depend upon the natural etreame for their eupply of water for hydraulic purpoees, are praying for more rain. It ie eeldom that a enpply to be depended npon comes before Fehrnary, and if it sbonld it would be too cold to use it in many parts of the connty.

It is asserted that Senator Jones has invested largely in qnartz mines in Eastern Oregon. The *Bedrock Democrat* speaks in very hopeful terms of the mining prosperity of that section of the State.

Refining Base Bullion in San Francisco.

The journalist should be always ready to chronicle the inauguration of new enterprises, says the San Francisco *Journal of Commerce*, especially those that help to nevelop the resources of the Coast. But while doing this and giving the promoters all the credit that is justly their due, it is not meant to forget pioneers, and to totally ignore important facts in the baste to glorify some new co-worker in an old field. Yet this has lately been done by a contemporary in this city. Unwittingly and without malice we presume, but the unjustice done is none ths less glaring, and the impression produced abroad of our industrial progress none the less erroneous.

We refer to the account given some time since of the prospects of the Kohler Refining Works, in which it was asserted that the establishment of this institution would cause the Base Bullion from Eureka and from all parts of Central and Western Nevada to come here for sale and treatment, as the saving in freight and time, owing to the diminished distance, would be enormous. In the same article it was stated of the Selby Refining Works that the balance and major part of the crude Bullion turned out was shipped to New York.

Now what are the facts? That for many years the refining of crude Bullion has been carried on at the Selby Works at North Beach, which form in themselves the most important industrial establishment of the city or coast, and one of the most important in America. During the past year not less than twelve thousand tons of refined Pig Lead has been turned out here, of which ten thousand tons have been shipped to New York. If all that was needed to have the Crude Lead Bullion of the Coast refined in, or near this city, was the establishment of a refinery, that desideratum has been long ago supplied. The capacity of the Selby Works is not less than twenty thousand tons annually, so that all the Crude Bullion turned out on the coast could be refined there. In addition to the refined Lead there is also produced a large amount in Silver. The growth of this industry has not been one of the least notable things in the history of the city, the production having increased from 1,900 tons tn 1870 to 12,000 tons in 1874, and the value from $200,000 in 1870 to $1,500,000 in 1874. The labor employed has increased in the same ratio from 15 hands in 1870, to 70 in 1874.

This progress is reasonably rapid, and when it is known that 2,000 tons of the Lead thus refined is utilized in this city, it will be allowed that San Francisco does not occupy after all such a backward position in this market as has been represented. There is no need of new establishments to refine the crude Bullion that should come to this city, but this will not be so in a year or two if we are to judge hy the progress of the past. There will not only be room for the Kohler Refining Works hut for many others if our anticipations should prove correct, so that San Francisco bids fair to become one of tbe most important Lead Refining centers in the world. The Lead mines of the coast are practically inexhaustible, and in future years we will supply the world with Lead as we do now with Gold and Silver.

We now refer only to the refining of Lead, but there is no reason why we should not manufacture it, and thus build up a vast and varied industry, and one which would of itself task the resources of a great city. San Francisco is situated the same with regard to the great Lead region of the coast that Philadelphia is to the great Coal and Iron region of Pennsylvania, and that Birmingham and Manchester are to the great Coal and Iron bearing districts of England. The refining works at North Beach and the Shot Tower are but the foundation stone of a vast and splendid industrial system which shall number similar establishments by the score, and which shall employ millions of dollars and thousands of men. The credit of pioneering all this will however be due to Mr. Selby, and this should not be forgotton even in extending an enthusiastic welcome to a co-worker in the field of industrial progress.

Hot Water.—The water encountered in the main east drift on the 2,000-foot level of the Imperial Empire mine is the hotteet ever struck on the Cometock lode. It was carefnlly tested with two good thermometere, and the temperature was found to he 150½ degrees. This stream of water is but an inch or two in diameter. The temperature of the atmosphere in the drift was 115 degrees, when the water wae teeted.

Discharge of Pipe.—A correspondent asks ne the following questione: How mnch water will discharge tbrough a pipe 4¼ inches in diameter, 1¼ milee long, with 70 feet fall or nearly a gradnal descent, fed by a reservoir five feet deep, or five feet pressure at head. It will diecharge 160 gallons per minute.—Ede. Prese.

A Meeting was held on the 16th, at Hollister, to take action regarding the proposed narrow gauge railroad from Hollister to salt water at San Juan. It wae agreed to organize a company with a capital of $500,000, in shares of $100 each.

Silver bullion to the value of nearly $600,000 from Pioche, Nevada, hae been received at Salt Lake City by Wells, Fargo & Co., this season.

The shaft heing drained once more, work is heing resumed in the Tyler mine.

Antimony is worth in Liverpool £50 to £51 for regulue.

Quicksilver is £25 per flask in Liverpool.

The foundry at Belmont has started up.

General News Items.

The Irwin examination at Washington appears to hs attractiog mnch interest—almost as much as did that of Von Arnim at Berlin. Irwin claims to have dishursed over half a million dollare for the company to obtain a subsidy from Congress for the China Mail servics. He is now called before Congress to testify as to whers this money was paid. The position of Irwin may hs imagined from the circumstance that it will not do to admit that the monsy was paid to corrupt memhers of Congress, and in the event he oannot show where it was paid, hs will be liahle to return it to the company. Mr. Irwin's illnsss has thus far prevented any extended examination. He appears disposed at first to make a pretty clsar breast of it, and mnch interest was manifested to hear his story; hnt he since msnifested a disposition to withhold the names of the parties to whom he paid the money.

The Katie King Fraud.—Thsre appsars to he no doubt now that the pretsnded spirit manifestations connected with the name of Katie King were an nnmitigated fraud. Robert Dale Owen and Dr. Childs, two leading Spiritnalists of Philadelphia, pnblish and repndiate the ewindls. Is it not astonishing that so many otherwise sensible psople can he deceived and carried away with ths follies and frands of Spiritnalism, as exhibited in its various seusational forms? That there are many important facts connected with psychology and mind rsading, the philosophy of whioh is not yet fnlly nnderstood, there can he no doubt. And that they will eventually be referred to natural canses and hrought into snbjection by natural laws, there need hs as little doubt.

A Goon Result.—The success of the "Farmers' Road," so called in Montsrsy connty, has indnced quite a gensral dssire for local intercommnnication by short lines of railroad owned and controlled hy those immediately interested in their construction. A mass meeting was held at Hollister on the 17th instant to take measures to huild a local narrow gange road from Hollister to San Juan, with very satisfactory results. There is also a movsment to construct a narrow gsnge road from the town of Sonoma to Popper's landing.

Kansas Sufferers.—Gov. Oshorn, of Kansae telsgraphs that he estimatss the numbsr of people in Western Kansae that will require assistance during the winter at 20,000. Msny of these are now in a state of actual want. The prospect for the wheat crop is good, and the winter so far has heen mild and favorable. Donations may be sent to Lieutenant-Governor Stovsr, Chairman of the Central Relief Committes, Topska. The things most needed are food and clothing for womsn and children.

Another Pacific Mail Disaster.—The Pacific Mail steamship "Japan" was burned on Thursday last, when within eighty miles of her destination; but only twelve miles from Swatow. It is supposed that the passsngers and crsw were all landed safely in the boats. A large portion of them havs already been hsard from. The ship, togsther with the mails, treasnre ($375,000), cargo and baggags ie a total loss.

Another Dam Breaks.—The Haydenville dam in Massachusetts, which was destroyed at the time of the grsat Mill Creek disaster in May last, hroke again a few days since, caosing great damagss but no loss of life. After the terrible warning received it would seem that sufficient ekill would have heen shown to have rendered the new one perfectly secure, hut it appears that few can appreciate the great power of water.

Building a Wing Dam.—W. A. Dewey has commenced operatione in the constrnction of a wing dam, for the protection of the ranchee on the Yolo eide of the river, at the first hend helow Sacramento, and will pnsh the work as rapidly as poesihle, hoping to complete it hefore another extensive rise in the river ehsll take place.

The War of Races.—It is now eaid that there were about 71 colored persons killed and a large nnmber wonnded in the late affair at Vicksburg. The affair seems to have been a massacre, as only two whites are reported killed.

Bradlaugh, the great English workingman's advocate ie coming to Californuia—so it ie said. Bradlangh ie no douht doing a great and good work, alheit it he is reported to he, as Tom Paine was, a very profane man in religion.

Von Arnim has heen sentenced to three monthe' imprisonment and cost of prosecntion —a very light penalty, if any whatever is inflicted; hut he is not inclined to submit, as report says he ie moving for a new trial.

Snow Storm at the East.—Eight or ten inches of snow fell in New York on Snnday, and a fall of twenty inches is reported in Pattereon N. J. Tbe storm is eevere, and extends throngh the Eastern and Middle Statee.

King Kalakaua's vieit, it is thought by many, will result in reciprocity and a loan to the Island government of one million dollars. Perhaps so—we shall see.

Hotel Burned.—Clondman'e hotel, eight miles helow Chinese Camp, on the Knight's Ferry road, was bnrned on Tnesday; lose, $1,500.

Refuses the Reward.—Dick Shafer, to whom Granice applied for shelter from the fog, hae refused to accept the $800 reward.

The shortest day for the year has passed, and from Tnesday last to the 21st of Jnne the days will lengthen.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Dec. 22d, 1874.

For Week Ending Dec. 8th, 1874.*

Rotary Harrow.—Walter G. Read, Colusa, Cal.

Smoke and Gas Consumer for Engines.—David Matthsw, Portland, Orsgon.

Reissues.

Concentrator.—Joshua Hsndy, S. F., Cal.

Ore Concentrator.—Joshua Hendy, S. F., Cal.

———*The patente are not ready for delivery by the Patent Office until some 14 days after the date of issne.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the ehortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the ehortest time possible.

Industrial Items.

The Oldest Piece of Iron.—Mr. Hanks lately exhihited a piece of iron, used to fasten togsther the stones composing the Servian wall, built around Rome 475 yeare B. C., more or lsss, and which was taken from a deep cut for a modern railroad, by Mr. Lsvi Goodrich, architect, of San Francisco. The face of the fragment was polished and aoted npon hy nitric acid, showing nnnsually largs crystals, and for the purpose of comparison a piece of modern iron wss exhibited. Is not this the oldest piece of iron in the world? and if iron improves by resting, as ssems to he showu hy the evident improvement in old razors, case knives, etc., this must be a very supsrior piece of metal. What did the microscope revsal when it was placed in comparison with "a piece of modern iron?"

Something New in Estimates.—It is ststed that the total cost of bnilding the north wing of the female department of the State Insane Asylnm was $88,511.83. The Legislature appropriated $113,000 for this purpose—a sum considered a fair estimate of its cost. Coming within an enginser's estimate is something new —in California at least.

Peat Manufactory.—Ths Stockton *Herald* states that a peat manufacturing company to mannfacture that article for fuel is shortly to bs started at Head Reach, on the San Joaquin rivsr.

Eight vesssls are in course of construction at Humboldt Bay.

Mining Suit.—Ths cass of Grsat and Dickerson vs Jemison, brought hefore the Supreme Conrt of the U. S. from the California Circuit Conrt brought hy plaintiffs to recover some $3,000 on promissory notes given as part payment on the purchase of the Alhsrt mioing claim, has hesn submitted to the Supreme Conrt for review, on a printed hrief. The defsnse was that the mine did not turn out so rioh as represssnted by ths vendors, and the oourt exclnded evidence offered to show that the Tehama mine, some 400 or 500 feet away, wae not worth working, ae irrelevant. This ie the chief error assigned, and the qnestion ie whether the production of an adjacent mine is admissahle in euch a case as evidence.

Our Agents.

Our Friends can do mnch in ald of our paper and the canee of practical knowledge and eclence, by assisting Agents in tbeir lahors of canvaseing, by lending their influence and encouraging favore. We intend to send none but worthy men.

Chas. T. Bell—Alameda, Santa Clara and Santa Cruz Countiee.

J. W. Anderson—Orange and Santa Ana, in Los Angeles Connty, Cal.

J. G. Kelley—For Washington Territory.

B. W. Crowell—California.

F. B. Alderson—City egent, San Francieco.

George Decker—Solano County.

J. L. Tharp—Southern California.

C. H. Wheeler—Southern California.

A. O. Champion—Tnlare, Fresno and Inyo Countiee.

D. J. James—Anetralian Colonies.

J. C. Ewing—Contra Coeta County.

John Rostran—Sonoma County.

J. W. Riley—San Joaquin and Stanislane Conntiee.

W. C. Quinby, Eastern and Western Statee.

Better Than Going South.—"Go Sonth! Go Sontb!" is tbe parrot cry of the friends of tbe consumptive. It is well meant, but silly. Few of thoso wbo are suffering from lung and throat complainte can go Sontb, or would be benefitted if they did go. *Hale's Honey of Horehound and Tar* is worth more than millions of cubic feet of soutbern air as a remedy for every species of pulmonary complaint. It will cure any cough, any cold, any bronchial complaint, and will effectnally arrest tbe tendency to consumption.

Pike's Tooth-Ache Drops—Cure in one minnte

Wood Cuts for Sale.

We are willing to sell a large nnmber of the wood cuts and electrotypes wbich bave appeared in tbe Pazes, on very liberal terms to publishers abroad, and would invite correspondence on tbat business.

Woodward's Gardens embracee an Aquarium, Museum, Art Gallery, Conservatories, Tropical Honses, Menagerie Seal Ponds, and Skating Rink. Admiesion, 25 cents; children, 10 cents.

Subscribers wbo are troubled in getting their papers regularly from the P. O. sbonld be particular to mention the name of tbe paper.

S. F. Gold and Silver Platino Works, 655 Mission St, advertisement appears first Saturday of every month.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken ont; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken np and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long prsctics in patent bnsiness, enable ne to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most stsadfast friends and patrons, who fnlly appreciate our advantages in bringing valnable inventions to the notice of the public through the colnmns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity. .

Foreign Patents.

In addition to Amsrican Patents, ws sscurss with ths assistance of co-operativs agents, claims in all foreign countriee which grant Patents, including Great Britain, France, Belgium, Prussia, Anstria, Victoria, Pern, Rnecia, Spain, Britieh India, Saxony, Britieh Columbia, Canada, Norwny, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cnba, Roman States, Wurtemberg, New Zealand, New Sonth Wales, Queensland, Tasmania, Brnzil, New Grenada, Chile, Argsntins Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainabls.

No models ars required in Europsan countries, but the drawings and specificatione should be prepared with thoroughnese, by able persone who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all casss, will alwaye be as low, and in some instances lowsr, than those of any othsr responeible agency.

Ws *can and do* get foreign patente for inventors in the Pacific States from two to eix months (according to the location of the conntry sooner than any othsr agsnts.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast hae familiarized na with the character of moet of the inventione already patented; hence we are frequently able to save our patrone the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are alwaye free to advise applicante of any knowledge we have of previone applications which will intsrfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventione and patent right business, believing that the mutual conference of lsgitimate business and profeecional men is mutual gain. Partiee in doubt in regard to their righte ae asoignees of patente, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, somstimes miscarry, and it has repeatedly happened that applicants have not only loet their money, but their inventions also, from this cause and conecquent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of thie coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated eo remote from the seat of government, delays are even more dangerous to the inventore of the Pacific Coast than to applicants in the Eastern Statee. Valuable patente may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great paine to preserve seorecy in all confidential matters, and applicants for patents can rest assured that their communications and business tranеactions will be held strictly confidential by us. Circulars frse.

Engravings.

We have superior artiste in our own offics, and all facilitiee for producing fine and eatisfactory illnetratione of inventione and machinery, for newspaper, book, circular and other printed illuetrations, and are always ready to aesist patrone in briuging their valuable inсoverice into practical and profitable use.

United States and Foreign Patent Agents, pnblishers Mining and Scientifio Press and the Pacific Rural Presе, 224 Sansome St., S. F.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issned, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY CUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and ths Extraction of their Respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silvor ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of fnrnaces, implements and working apparatus.

It is a work of great merit, by an author whose repn tation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and miuerals, which cannot be found elsewhere in print. It also abonnds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially or the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the Ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $5 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

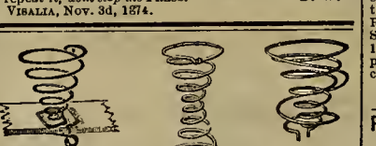
Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

Location of Dewey & Co.'s New Offices since July, 1874.

DON'T STOP THE PRESS.—A subscriber in Tulare county, in sending us the renewal of his subscription, adds the following: "Don't stop the Press; I'd just as soon you would stop a portion of my bread. It is a welcome friend to our fireside. Wife is just as deeply interested as I am, and would sooner sacrifice her tea than forego the pleasure of reading the Press. The young Grangers in our family, with sparkling eyes and swift coming feet, gather around to look at the ever new and unfolding wonders to be found in the Press. I repeat it, *dont stop the* PRESS." D. W.

VISALIA, Nov. 3d, 1874.



Self-Fastening Bed-Spring. Double-Spiral Bed-Spring.

We manufacture all sizes of BED and FURNITURE SPRINGS, from No. 7 to the smallest Pillow Spring; also, the Donblo Spiral Spring, which is the most durable Bed Spring in use. It is adapted to upholstered or skeleton beds. We have the sole right in this State to make the celebrated Obermann Self-Fastening Bed Spring. Any man can make his own spring bed with them. They are particularly adapted to Farmers' and Miners' use. Send for Circulars and Price List to

J Clem Uhler, trustee	57	274	274 00

And in accordance with law, and an order of the Board of Directors, made on the tenth day of November, 1874, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the salesroom of John Middleton & Son, No. 310 Montgomery street, San Francisco, on the eleventh day of January, 1875, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Secretary.

Office—Northwest corner Sansome and Pine streets, San Francisco, Cal. dec26-3t

Martin and Walling Mill and Mining Com-

pany Principal place of business, San Francisco, Cal. Location of works, Coulterville District, Mariposa County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of December, 1874, an assessment (No. 1) of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company in San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 8th day of January, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the 23d day of January, 1875, to pay the delinquent assessment together with costs of advertising and expenses of sale.

J. W. TRIPP, Secretary.

Office.—Room 6, 408 California street, San Francisco.

Owens Gold and Silver Mining Company.

Location of principal place of business, San Francisco, Cal. Location of Works, Julian Mining District, San Diego County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment, (No. 3,) levied on the second day of November, 1874, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Joseph Storey	1	10	$10 00
J Q Lytle	2	10	10 00
A Pauly & Sons	4	10	10 00
Jas D Lynch	22	10	10 00
W R De Frees	23	300	300 00
W R De Frees	60	150	150 00

And in accordance with law, and an order of the Board of Directors, made on the second day of November, 1874, so many shares of each parcel of said stock as may be necessary, will be sold at public auction by the Secretary at the office of the Company, Room No. 4, Hayward's Building, 419 California street, San Francisco, on Monday, the 28th day of December, 1874, at the hour of one o'clock, P. M., of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale.

FRANK SWIFT, Secretary.

Office, 419 California street, San Francisco, Cal.

Page Tunnel Company.—Location of

principal place of business, San Francisco, California. Location of works, Big Cottonwood District, Salt Lake County, Utah.

Notice is hereby given, that at a meeting of the Directors, held on the 12th day of December, 1874, an assessment of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 2, No. 408 California street, San Francisco California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1875, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 20th day of February, 1875, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

JACOB HARDY, Secretary.

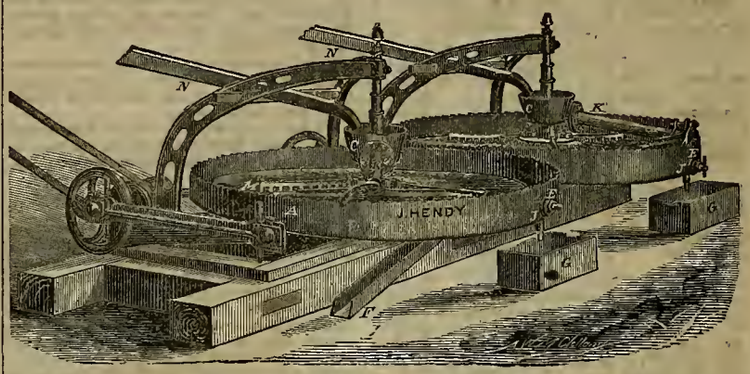
OVER $3,500 PER MONTH SAVED

BY THE USE OF

Hendy's Improved Amalgamator and Concentrator



Can be seen at the Manufactory, No. 32 Fremont Street, San Francieco.

SAN FRANCISCO, April 27, 1872.

JOSHUA HENDY, Esq.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them, for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).
2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.
4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,
JAS. H. CROSSMAN, M. E.
409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

OFFICE SUPERINTENDENT OF KEYSTONE CON. M. CO., AMADOR, AMADOR COUNTY.

MR. J. HENDY—*Dear Sir:*—In answer to your inquiries as to your Concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over $3,500 per month more than with the blankets and huddles formerly in use.
O. C. HEWITT, Supt.

OFFICE SUMNER MINE, KERNVILLE, April 27, 1874.

J. HENDY, Esq.—*Dear Sir:* Having four of your Concentrators in use at our Mills for four or five months, which for saving Amalgam and for concentrating Sulphurets, are a success, beyond a doubt, I feel it a duty due you and those interested in Quartz Mills, to recommend them.

As further evidence of their worth, I now order TWELVE more of your Machines for our new Mill, now in course of erection.
E. R. BURKE, Superintendent.

For description send for Circular.

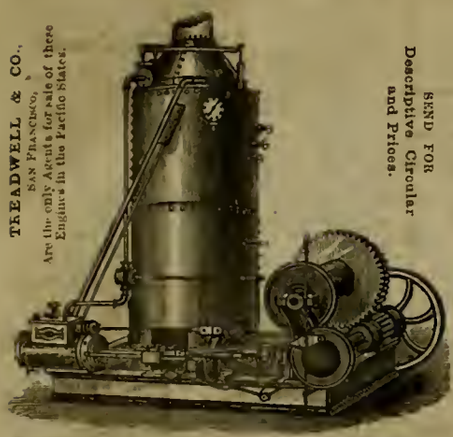
IMPROVED HOISTING ENGINES.

HOISTING ENGINES.

—o—



TREADWELL & CO., SAN FRANCISCO, Are the only Agents for sale of these Engines in the Pacific States.

SEND FOR Descriptive Circular and Prices.

COOK, RYMES & CO.'S Celebrated Hoisting Engines have been too long in use on the Pacific Coast to require any special recommendation from us. We refer with confidence to any one of the hundreds now in use. We simply state that they still sustain their old reputation, the manufacturers not having followed the now too common practice of reducing the quality of material and workmanship for the sake of competing with cheaper engines. For details of sizes send for price list. We desire to call particular attention to our new

MINING HOISTING ENGINES.

(Manufactured by the same parties.)

Which have just been introduced on this Coast. The plans and specifications are the combined efforts of our MOST SUCCESSFUL MINING ENGINEERS, and the result is the most complete

DOUBLE-DRUM HOISTING ENGINE

Ever built. Their advantages will be seen at a glance by any one familiar with the necessities of a mine. One of these engines may be seen at work in the Belcher mine, and one in the Ophir, on the Comstock lode, to both of which we refer. ☞ We have all sizes of these engines constantly on hand. For sale only at

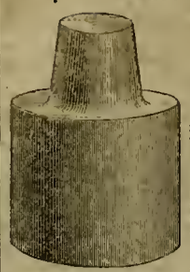
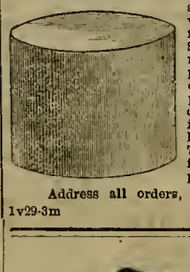
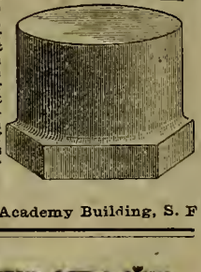
Improved Cast and Forged Steel Shoes and Dies for Quartz Mills.







[PATENTED MAY 26TH, 1874.]

Price Reduced to 16 Cents Per Pound.

SAN FRANCISCO, November 10th, 1874.

To Supts. of Quartz Mills and Mining Men generally:

We take pleasure in stating that owing to the rapid increase in our orders, our Pittsburg Manufacturers have been compelled to add largely to their works—a new gas furnace and heavier trip hammer—and are thus enabled to reduce the cost of steel and at the same time produce SHOES AND DIES superior to any yet manufactured. We have consequently reduced the price to 16 cents per pound and solicit a trial order, guaranteeing that you will find them at least 10 per cent. cheaper than the best iron. There are no STEEL SHOES AND DIES made excepting under our patent and sold at this office, or by our authorized agents, though certain Eastern manufacturers advertise STEEL SHOES AND DIES which are only cast iron hardened by the addition of a composition. They will not out-wear two sets of common iron, though called steel. They are very brittle and are not capable of being tempered, flying from under the hammer like cast iron. Our STEEL SHOES AND DIES are in use in many of the largest mills on the Pacific Coast, and all who have tried them pronounce them cheaper and far superior to iron in every respect, even at the old price of 20 cents per pound. Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. It takes 50 days to fill orders from the manufactory East. Price 16 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to
